Physics and Modelling of Wind Erosion Yaping Shao, 2008-10-13 Wind erosion occurs in many arid semiarid and agricultural areas of the world. It is an environmental process influenced by geological and climatic variations as well as human activities. In general, wind erosion leads to land degradation in agricultural areas and has a negative impact on air quality. Dust emission generated by wind erosion is the largest source of aerosols which directly or indirectly influence the atmospheric radiation balance and hence global climatic variations. Strong wind erosion events such as severe dust storms may threaten human lives and cause substantial economic damage. The physics of wind erosion is complex as it involves atmospheric, soil, and land surface processes. The research on wind erosion is multidisciplinary, covering meteorology, fluid dynamics, soil physics, colloidal science, surface soil hydrology, ecology, etc. Several excellent books have already been written about the topic, for instance by Bagnold (1941) *The Physics of Blown Sand and Desert Dunes*, Greeley and Iversen (1985) *Wind as a Geological Process on Earth, Mars, Venus, and Titan*, Pye (1987) *Aeolian Dust and Dust Deposits*, Pye and Tsoar (1990) *Aeolian Sand and Sand Dunes*. However, considerable progress has been made in wind erosion research in recent years and there is a need to systematically document this progress in a new book.

Soil Erosion in Europe John Boardman, Jean Poesen, 2007-01-11 Provides a unique and comprehensive assessment of soil erosion throughout Europe, an important aspect to control and manage if landscapes are to be sustained for the future. Written in two parts, *Soil Erosion in Europe* primarily focuses on current issues, area-specific soil erosion rates, on and off-site impacts, government responses, soil conservation measures, and soil erosion risk maps. The first part overviews the erosion processes and the problems encountered within each European country, whilst the second section takes a cross-cutting theme approach. Based on an EU-funded project that has been running for four years with erosion scientists from 19 countries, it reviews contemporary erosion processes and rates on arable and rangeland in Europe. Looks at current issues such as socio-economic drivers, controlling factors specific to the country, and changes in land use.

Dryland Ecohydrology Paolo D'Odorico, Amilcare Porporato, 2006-01-09 Ecohydrology emerges as a new field of research aiming at furthering our understanding of the earth system through the study of the interactions between the water cycle and vegetation. By combining the analysis of biotic and abiotic components of terrestrial ecosystems, this volume provides a synthesis of material on arid and semiarid landscapes which is currently spread in a number of books and journal articles. The focus on water-limited ecosystems is motivated by their high sensitivity to daily, seasonal, and decadal perturbations in water availability and by the ecological, climatic, and economic significance of most of the drylands around the world. Conceived as a tool for scientists working in the area of the earth and environmental sciences, this book presents the basic principles of ecohydrology as well as a broad spectrum of topics and advances in this research field. The chapters collected in this book have been contributed by authors with different expertise who work in several arid areas around the world. They describe the various interactions among the biological and physical dynamics in dryland ecosystems.

starting from basic processes in the soil vegetation climate system to landscape scale hydrologic and geomorphic processes ecohydrologic controls on soil nutrient dynamics and multiscale analyses of disturbances and patterns

Soil Science: Agricultural and Environmental Prospectives Khalid Rehman Hakeem,Javaid Akhtar,Muhammad Sabir,2016-08-01 Soil is the most important natural non renewable resource developed

over a longer period of time due to weathering of rocks and subsequently enrichment of organic matter Soil provides habitat for numerous microorganisms and serves as a natural medium for plant growth thereby providing the plants with anchorage nutrients and water to sustain the growth Soil also serves as a universal sink for all types of pollutants purifies ground water and is a major reserve of carbon in the universe The role of soils to provide ecosystem services maintenance of environmental human health and ensuring the food security makes it as the most important and basic natural resource Soil Science helps us to elaborate and understand how the soils provide all these services Soil Science also provides us the basic knowledge dealing with the origin of the soil parent material weathering of parent material and the formation of soils morphological physico chemical and biological features of soils classification of soils and role of soils in the provision and maintenance of ecosystem services food security and environmental quality This book encompasses the various processes functions and behaviour of soils very comprehensively to acquaint the students of soil plant and environmental sciences about their role to perform different agricultural and environmental functions

Variability of Air Temperature and Atmospheric Precipitation in the Arctic Rajmund Przybylak, 2006-04-11 It has been known at least since the end of the century that the polar areas play a very important role in the formation of the Earth's climates It is also known today that they are the most sensitive regions to climatic change and are thus perfect case studies for the detection of such changes The most serious obstacle to the study of climatic and other geographical elements of the polar areas including the Arctic has always been the severe climatic conditions which prevail in these regions Because of these extreme conditions research into particular elements of the climatic system including the atmosphere began here much later than it did in lower latitudes For instance the whole area of the Arctic was not sufficiently covered with a network of meteorological stations until the late 1940s and even then there were large areas of the central Arctic and the Greenland interior for which no data were available This is probably why it was not until the start of the 1990s that a body of work began to appear which analysed in any depth climatic variability for the Arctic as a whole While a considerable number of papers had been published before this period most of them were local studies presenting highly localised information providing air temperature measurements but often little else

The Near-Surface Layer of the Ocean Alexander Soloviev, Roger Lukas, 2006-03-13 Until the 1980s a tacit agreement among many physical oceanographers was that nothing deserving attention could be found in the upper few meters of the ocean The lack of adequate knowledge about the near surface layer of the ocean was mainly due to the fact that the widely used oceanographic instruments such as bathythermographs CTDs current meters etc were practically useless in the upper few meters of the ocean Interest in the near surface layer of the ocean rapidly increased along with the development of remote sensing techniques The interpretation of ocean surface signals sensed from satellites demanded thorough knowledge of upper ocean processes and their connection to the ocean interior

Despite its accessibility to the investigator the near surface layer of the ocean is not a simple subject of experimental study. Random sometimes huge vertical motions of the ocean surface due to surface waves are a serious complication for collecting quality data close to the ocean surface. The supposedly minor problem of avoiding disturbances from ships wakes has frustrated several generations of oceanographers attempting to take reliable data from the upper few meters of the ocean. Important practical applications nevertheless demanded action and as a result several pioneering works in the 1970s and 1980s laid the foundation for the new subject of oceanography: the near surface layer of the ocean.

Meteorologische Zeitschrift, 2006 **Cloud Optics** Alexander A. Kokhanovsky, 2011-03-07. Clouds affect the climate of the Earth and they are an important factor in the weather. Therefore their radiative properties must be understood in great detail. This book summarizes current knowledge on cloud optical properties: for example their ability to absorb, transmit and reflect light, which depends on the clouds' geometrical and microphysical characteristics such as sizes of droplets and crystals, their shapes and structures. In addition, problems related to the image transfer through clouds and cloud remote sensing are addressed in this book in great detail. This book can be an important source of information on theoretical cloud optics for cloud physicists, meteorologists and optical engineers. All basic ideas of optics as related to scattering of light in clouds, e.g. Mie theory and radiative transfer, are considered in a self-consistent way. Consequently, the book can also be a useful textbook to newcomers to the field.
