

Practice Problems: Quantum Theory

CHEM 1A

1. Hydrogen has a red emission line at 656.3 nm, what is the energy and frequency of a photon of this light? Note: Planck's constant = 6.626×10^{-34} J·s, speed of light = 2.998×10^8 m/s

$$E_{\text{photon}} = h\nu = \frac{hc}{\lambda}$$

$$E_{\text{photon}} = \frac{(6.626 \times 10^{-34} \text{ J}\cdot\text{s}) (2.998 \times 10^8 \text{ m/s})}{656.3 \text{ nm} \left(\frac{10^{-9} \text{ m}}{1 \text{ nm}} \right)}$$

$$E_{\text{photon}} = \underline{3.02677861 \times 10^{-19} \text{ J}}$$

$$\nu = \frac{c}{\lambda}$$

$$\nu = \frac{(2.998 \times 10^8 \text{ m/s})}{656.3 \text{ nm} \left(\frac{10^{-9} \text{ m}}{1 \text{ nm}} \right)}$$

$$\nu = \underline{4.568032912 \times 10^{14} \text{ s}^{-1}}$$

Answer (E): $3.027 \times 10^{-19} \text{ J}$ Answer (ν): $4.568 \times 10^{14} \text{ s}^{-1}$ or Hz

2. What is the de Broglie wavelength for an electron moving at 2.42×10^6 m/s?
Note: $m_e = 9.109 \times 10^{-31}$ kg

$$\lambda = \left(\frac{h}{mv} \right)$$

$$\lambda = \left(\frac{6.626 \times 10^{-34} \text{ J}\cdot\text{s}}{(9.109 \times 10^{-31} \text{ kg}) (2.42 \times 10^6 \text{ m/s})} \right) = \underline{3.00583657 \times 10^{-10} \text{ m}}$$

Answer: $3.01 \times 10^{-10} \text{ m}$ $\longleftarrow$ many orders of magnitude larger than the diameter of an electron

3. Using the Bohr equation, calculate is the change in energy when an electron transitions from $n = 3$ to $n = 2$ in a hydrogen atom.

$$\Delta E = -2.18 \times 10^{-18} \text{ J} \left(\frac{Z^2}{n_{\text{final}}^2} - \frac{Z^2}{n_{\text{initial}}^2} \right)$$

$$\Delta E = -2.18 \times 10^{-18} \text{ J} \left(\frac{1^2}{2^2} - \frac{1^2}{3^2} \right)$$

$$\Delta E = \underline{-3.02777778 \times 10^{-19} \text{ J}}$$

Answer: $-3.03 \times 10^{-19} \text{ J}$

A Quantum Computation Workbook Mahn-Soo Choi, 2022-03-03 Teaching quantum computation and information is notoriously difficult because it requires covering subjects from various fields of science organizing these subjects consistently in a unified way despite their tendency to favor their specific languages and overcoming the subjects abstract and theoretical natures which offer few examples of actual realizations In this book we have organized all the subjects required to understand the principles of quantum computation and information processing in a manner suited to physics mathematics and engineering courses as early as undergraduate studies In addition we provide a supporting package of quantum simulation software from Wolfram Mathematica specialists in symbolic calculation software Throughout the book s main text demonstrations are provided that use the software package allowing the students to deepen their understanding of each subject through self practice Readers can change the code so as to experiment with their own

ideas and contemplate possible applications The information in this book reflects many years of experience teaching quantum computation and information The quantum simulation based demonstrations and the unified organization of the subjects are both time tested and have received very positive responses from the students who have experienced them Study Guide and Student Solutions Manual for Wilson College Physics David Cordes, Jerry D. Wilson, John Kinard, 1990 This reader friendly book presents the fundamental principles of physics in a clear and concise manner Emphasizing conceptual understanding as the basis for mastering a variety of problem solving tools it provides a wide range of relevant applications and illustrative examples This book discusses mechanics thermodynamics and oscillations and wave motion For anyone wishing to learn more about the fundamentals of physics and how physical principles apply to a variety of real world situations devices and topics A Student's Guide Through the Great Physics Texts Kerry Kuehn, 2015-12-17 This book provides a chronological introduction to modern atomic theory which represented an attempt to reconcile the ancient doctrine of atomism with careful experiments performed during the 19th century on the flow of heat through substances and across empty space Included herein are selections from classic texts such as Carnot's Reflection on the Motive Power of Fire Clausius Mechanical Theory of Heat Rutherford's Nuclear Constitution of Atoms Planck's Atomic Theory of Matter and Heisenberg's Copenhagen Interpretation of Quantum Theory Each chapter begins with a short introduction followed by a reading selection Carefully crafted study questions draw out key points in the text and focus the reader's attention on the author's methods analysis and conclusions Numerical and laboratory exercises at the end of each chapter test the reader's ability to understand and apply key concepts from the text Heat Radiation and Quanta is the last of four volumes in A Student's Guide through the Great Physics Texts The book comes from a four semester undergraduate physics curriculum designed to encourage a critical and circumspect approach to natural science while at the same time preparing students for advanced coursework in physics This book is particularly suitable as a college level textbook for students of the natural sciences history or philosophy It might also serve as a textbook for advanced high school or home schooled students or as a thematically organized source book for scholars and motivated lay readers In studying the classic scientific texts included herein the reader will be drawn toward a lifetime of contemplation Modern Physics John Morrison, 2009-12-30 Modern Physics for Scientists and Engineers provides an introduction to the fundamental concepts of modern physics and to the various fields of contemporary physics The book's main goal is to help prepare engineering students for the upper division courses on devices they will later take and to provide physics majors and engineering students an up to date description of contemporary physics The book begins with a review of the basic properties of particles and waves from the vantage point of classical physics followed by an overview of the important ideas of new quantum theory It describes experiments that help characterize the ways in which radiation interacts with matter Later chapters deal with particular fields of modern physics These include includes an account of the ideas and the technical developments that led to the ruby and helium neon lasers and a modern description of

laser cooling and trapping of atoms The treatment of condensed matter physics is followed by two chapters devoted to semiconductors that conclude with a phenomenological description of the semiconductor laser Relativity and particle physics are then treated together followed by a discussion of Feynman diagrams and particle physics Develops modern quantum mechanical ideas systematically and uses these ideas consistently throughout the book Carefully considers fundamental subjects such as transition probabilities crystal structure reciprocal lattices and Bloch theorem which are fundamental to any treatment of lasers and semiconductor devices Uses applets which make it possible to consider real physical systems such as many electron atoms and semi conductor devices *Book catalog of the Library and Information Services Division*

[Quantum Theory for Chemical Applications](#) Jochen Autschbach,2020-12-07 Quantum theory and computational chemistry have become integral to the fields of chemistry chemical engineering and materials chemistry Concepts of chemical bonding band structure material properties and interactions between light and matter at the molecular scale tend to be expressed in the framework of orbital theory even when numerical calculations go beyond simple orbital models Yet the connections between these theoretical models and experimental observations are often unclear It is important now more than ever that students master quantum theory if they are going to apply chemical concepts In this book Jochen Autschbach connects the abstract with the concrete in an elegant way creating a guiding text for scholars and students alike Quantum Theory for

Chemical Applications covers the quantum theory of atoms molecules and extended periodic systems Autschbach goes beyond standard textbooks by connecting the molecular and band structure perspectives covering response theory and more The book is broken into four parts Basic Theoretical Concepts Atomic Molecular and Crystal Orbitals Further Basic Concepts of Quantum Theory and Advanced Topics such as relativistic quantum chemistry and molecule light interactions The foresight Autschbach provides is immense and he sets up a solid theoretical background for nearly every quantum chemistry method used in contemporary research Because quantum theory tells us what the electrons do in atoms molecules and extended systems the pages in this book are full of answers to questions both long held and never before considered
