Rna Metabolism In Trypanosomes Rna Metabolism In Trypanosomes:

RNA Metabolism in Trypanosomes Albrecht Bindereif, 2012-06-12 Trypanosomes are unicellular protozoa of ancient evolutionary origin that are responsible for several tropical diseases such as African sleeping sickness Over the last few decades research in trypanosome biology has revealed many unique and fascinating features many of which have helped to establish new paradigms in other biological systems This applies in particular to studies in gene expression and regulation which benefit enormously from the trypanosome genome projects and from the new genome wide approaches recently introduced in trypanosome research This volume covers the most important aspects of biosynthesis processing and functions of RNA in trypanosomes ranging from transcription to RNA editing mRNA splicing translation turnover processing of transfer and ribosomal RNA RNA interference and current transcriptome wide analyses Recent progress in RNA focused research in trypanosomatids promises to yield novel insights into trypanosome specific features as well as to reveal in the process new potential therapeutic strategies for combating these parasitic diseases

RNA Metabolism in Mitochondria Jorge Cruz-Reyes, Michael W. Gray, 2018-06-12 This volume focuses on mitochondrial RNA metabolism emphasizing recent discoveries and technological advances in this fast moving area that increase our understanding of mitochondrial gene function Topics addressed include the interplay of mitochondria with the nucleus and cytosol structure function connections and relevance to human disease Mitochondria are the powerhouses of the cell and a great deal is known about mitochondrial energy metabolism Less well known is the plethora of amazing mechanisms that have evolved to control expression of mitochondrial genomes Several RNA processes and machineries in protozoa plants flies and humans are discussed including transcription and RNA polymerase mechanism tRNA processing of 5 and 3 ends mRNA maturation by nucleotide insertion deletion editing and by RNA splicing mRNA stability and RNA import Specialized factors and ribonucleoproteins RNPs examined include pentatricopeptide repeat PPR proteins RNase P polymerases helicases nucleases editing and repair enzymes Remarkable features of these processes and factors are either not found outside mitochondria differ substantially among eukaryotic lineages or are unique in biology

Regulation of RNA Metabolism by ARE-binding Proteins in Trypanosoma Brucei Zhiquan Lu, 2015 Trypanosomes are protozoan parasites that alternate between insect and mammalian hosts over the course of their life cycle In the absence of transcriptional control these parasites depend almost entirely on post transcriptional mechanisms to remodel gene expression in response to internal and external stimuli This is achieved through a complex network of trans acting RNA binding proteins RBPs and cis acting regulatory elements Our computational studies identified highly conserved adenosine uridine AU rich elements AREs in the 3 untranslated regions UTRs of a large number of Trypanosoma brucei mRNAs These ARE containing transcripts are up regulated in the stationary phase of in vitro cultured procyclic form cells and down regulated in stumpy and slender bloodstream form cells suggesting a role for AREs in the regulation of parasite differentiation The expression of ARE containing transcripts positively correlated with three RBPs

identified using sequence analysis as potential remote homologs of ELAV Embryonic Lethal Abnormal Vision proteins. In higher eukaryotes, proteins of the ELAV-like family regulate gene expression by stabilizing or promoting degradation of ARE-containing transcripts, suggesting a similar role for these proteins in regulating trypanosomatid ARE-containing mRNAs. Using *in vitro* electrophoretic mobility shift assays (EMSA) and RNA immunoprecipitation followed by deep sequencing (RIP-seq), we confirmed that the *T. brucei* ELAV-like proteins associate specifically and directly with ARE-containing transcripts. Furthermore, microarray analysis of overexpression and RNA interference (RNAi) knockdown cell lines suggests that the three identified ELAV-like proteins (ELAV-LPs) specifically regulate expression of ARE-containing transcripts. Understanding the role of the potential ELAV-LPs in the complex network of post-transcriptional regulation in *T. brucei* may elucidate new pathways and potential therapeutic targets for the treatment of trypanosomiasis.

Biology of Parasitism Christian Tschudi, Edward J. Pearce, 2013-03-14 *Biology of Parasitism* is based on the *Biology of Parasitism* Course at the Marine Biological Laboratory in Woods Hole, Massachusetts. Having just celebrated its 20th offering, this Course has distinguished itself as the premier world-renowned training ground for future generations of parasitologists. The primary goal of the Course is to attract and introduce the very best and most promising young researchers to the many unresolved problems in parasitology and prepare them for their future as independent investigators in the field. The rigorous program combines state-of-the-art laboratory research with a program of visiting lecturers who bring together the most current research in the field. Since at this time there are no academic institutions that have enough depth in parasitology research or teaching faculty to provide up-to-date and state-of-the-art training, the Course has become and will remain a global resource for providing intensive education in modern parasitology. *Biology of Parasitism* is intended to present a snapshot of the content and spirit of the *Biology of Parasitism* Course. By presenting a series of chapters that reflect the formal lectures that students receive on a daily basis, as well as the approaches used during the laboratory section of the Course, the editors hope to share some of the science that occurs there. One part of the book presents the experimental component of the Course in particular, the subject matter of the four two-week sessions covering Immunology, Biochemistry, Cell Biology, and Molecular Biology of protozoan and helminth parasites. As in the Course, the experimental part is complemented by a number of review-like chapters solicited from the large number of speakers who lecture during the Course.

The African Trypanosomes Samuel J. Black, J. Richard Seed, 2006-04-11 African trypanosomes are tsetse-transmitted protozoa that inhabit the extracellular compartment of host blood. They cause fatal sleeping sickness in people and Nagana, a wasting and generally fatal disease in cattle. While trypanosomes are most common to Africa, about 30% of Africa's cattle graze on the fringe of the tsetse habitat; some species have spread beyond its borders to Asia, the Middle East, and South America. *The African Trypanosomes*, volume one of *World Class Parasites*, is written for researchers, students, and scholars who enjoy reading research that has a major impact on human health or agricultural productivity and against which we have no satisfactory defense. It is intended to supplement

more formal texts that cover taxonomy life cycles morphology vector distribution symptoms and treatment It integrates vector pathogen and host biology and celebrates the diversity of approach that comprises modern parasitological research

Evolution of the Protein Synthesis Machinery and Its Regulation Greco Hernández,Rosemary Jagus,2016-08-10 The omics era has given a new perspective to the findings on the origin and evolution of the process of translation This book provides insight into the evolution of the translation process and machinery from a modern perspective Written by leading experts in molecular biology this text looks into the origins and evolution of the protein synthetic machinery

Santos,Marta H. Branquinha,Claudia M. d'Avila-Levy,Lucimar F. Kneipp,Cátia L. Sodr ,2013-11-22 This book contains a collection of critical reviews on the expression of biologically functional proteins in Leishmania and Trypanosoma which was written by renowned researchers on this field Species belonging to these trypanosomatids genera are etiological agents of leishmaniasis Chagas disease and sleeping sickness that are extremely debilitating human infection diseases which remain a major health problem especially in countries from Latin America Africa and Middle East Substantiating the problem the currently accepted drugs for these diseases are quiet unsatisfying due to their low efficacy and high toxicity In order to solve these real problems several research groups around the world have become involved in the study and identification of novel potential targets in the trypanosomatid cell Since proteins are key macromolecules involved in crucial metabolic processes of all living cells studies have focused on the expression of specific proteins produced by Leishmania and Trypanosoma by

means of different biochemical molecular and proteomic approaches in order to explore them as targets for understanding the parasite life cycle and developing new strategies against trypanosomiasis With these proposals in mind the book *Proteins and Proteomics of Leishmania and Trypanosoma* encompasses i an integrated view about the biochemistry of parasites belonging to the *Leishmania* and *Trypanosoma* genera ii an updated review on the expression of biologically relevant proteins by human pathogenic trypanosomatids and their possible role in the interaction with host cells molecules as well as a target for development of both alternative chemotherapies and vaccine and iii several pictures diagrams and tables that can be used to illustrate both undergraduate and postgraduate teaching as well as scientific lectures being a useful resource for students and researchers
