,1994 **Dynamical Systems VIII** V.I. Arnol'd,2013-03-09 In the first volume of this survey Arnol d et al 1988 hereafter cited as EMS 6 we acquainted the reader with the basic concepts and methods of the theory of singularities of smooth mappings and functions This theory has numerous applications in mathematics and physics here we begin describing these applica tions Nevertheless the present volume is essentially independent of the first one all of the concepts of singularity theory that we use are introduced in the course of the presentation and references to EMS 6 are confined to the citation of technical results Although our main goal is the presentation of analready formulated theory the readerwill also come upon some comparatively recent results apparently unknown even to specialists We pointout some of these results 2 3 In the consideration of mappings from C into C in 3 6 of Chapter 1 we define the bifurcation diagram of such a mapping formulate a $K n 1$ theorem for the complements to the bifurcation diagrams of simple singularities give the definition of the Mond invariant N in the spirit of hunting for invariants and we draw the reader s attention to a method of constructing the image of a mapping from the corresponding function on a manifold with boundary In 4 6 of the same chapter we introduce the concept of a versal deformation of a function with a nonisolated singularity in the dass of functions whose critical sets are arbitrary complete intersections of fixed dimension General Topology III A. V. Arhangel' skii,2013-03-09 The problem of metrization of topological spaces has had an enormous influence on the development of general topology Singling out the basic topo logical components of metrizability has determined the main reference points in the construction of the classification of topological spaces These are pri marily paracompactness collectionwise normality monotonic normality and perfect normality the concepts of a stratifiable space Moore space and u space point countable base and uniform base The method of covers has taken up a leading role in this classification Of paramount significance in the applications of this method have been the properties of covers relating to the character of their elements open covers closed covers the mutual

disposition of these elements star finite point finite locally finite covers etc as well as the relations of refinement between covers simple refinement refinement with closure combinatorial refinement star and strong star refinement On this basis a hierarchy of properties of paracompactness type has been singled out together with the classes of spaces corresponding to them the most important of which is the class of paracompacta The behaviour of families of covers with respect to the topology of a space has important significance Here first and foremost is the notion of a refining family of covers a development which appears in several modifications and together with the notion of paracompactness plays a key role in metrization problems
