Parvovet africanus:

Identify one observable trait that tells you this fossil primate belongs in the Parvovetia Clade.

Thick Molar Enamel

Identify one observable trait that tells you this fossil primate belongs in the Superfamily Hominoidea.

Long V-shaped Mouth

Gigantopithecus:

Identify similarities in observable traits between *Gigantopithecus* and a modern orangutan. Note: The modern orangutan is a juvenile so do not compare dental formula or size.

Both obtain an outwards extended mouth and teeth, this can be seen when looking at the side profile. In addition, when looking at the front profile, they both have narrow, long, oval-shaped, and close together eyes. Lastly, the shape of their teeth are very similar.

Gigantopithecus:

Identify the teeth (tooth type and how many of each type) that are present.

The *Gigantopithecus* has two incisors, one canine, two premolars, three molars and the dental formula is 2:1:2:3.

Examine the dental wear. What can you infer about the diet based on the dental wear?

Based on the unique features of its teeth (enlarged premolars and patterns of wear), and its massive size, the species has been known to have a wide range vegetation. This is because small silica particles (phytoliths) from grass were found stuck to the molars of the species and due to carbon isotopic composition of enamel, it suggested that *Gigantopithecus* wide range vegetation consisted of fruits, leaves, roots, and bamboo.

Evolutionary Cell Processes in Primates M. Kathleen Pitirri, Joan T. Richtsmeier, 2021-09-14 Many complex traits define the primate condition including behaviors as fundamental as locomotion and traits as scrutinized as the dentition and their study reveals dramatic evolutionary change across the primates Genetic modifications are at the basis of these changes but transformation of genetic information into phenotypes occurs at the level of the cell which is the focus of this book Contributors summarize novel methodologies to analyze the collective behavior of cells in forming tissues and organs influencing physiological functions and anatomical features that enable behaviors Our goal is to review current knowledge and encourage others to adopt evolutionary cell biology to aid in deciphering the genotype phenotype map that underlies the diversification of primates human variation and human evolution The contributors to this book utilize advances in genetic analysis and visualization of cells and tissues and merge evolutionary developmental biology with evolutionary cell biology to address questions central to understanding

Primates, Pathogens, and Evolution Jessica F. Brinkworth, Kate Pechenkina, 2013-08-30 The immune systems of human and non human primates have diverged over time such that some species differ considerably in their susceptibility symptoms and survival of particular infectious diseases Variation in primate immunity is such that major human pathogens such as immunodeficiency viruses herpesviruses and malaria inducing species of Plasmodium elicit striking differences in immune response between closely related species and within primate populations These differences in immunity are the outcome of complex evolutionary processes that include interactions between the host its pathogens and symbiont commensal organisms The success of some pathogens in establishing persistent infections in humans and other primates has been determined not just by the molecular evolution of the pathogen and its interactions with the host but also by the evolution of primate behavior and ecology microflora immune factors and the evolution of other biological systems To explore how interactions between primates and their pathogens have shaped their mutual molecular evolution *Primates Pathogens and Evolution* brings together research that explores comparative primate immune function the emergence of major and neglected primate diseases primate microorganism molecular interactions and related topics This book will be of interest to anyone curious as to why infectious diseases manifest differently in humans and their closest relatives It will be of particular interest to scholars specializing in human and non human primate evolution epidemiology and immunology and disease ecology *Primates Pathogens and Evolution* offers an overview and discussion of current findings on differences in the molecular mechanics of primate immune response as well as on pathogen mediated primate evolution and human and non human primate health

advancement of these fields and to the conceptual bases of primate brain evolution Both methods are important and a synthesis is desirable To this end two symposia were held in 1980 one at the meeting of the American Association of Physical Anthro pologists in Niagara Falls U S A and one at the precongressional meeting of the International Primatological Society in Torino Italy **Parasite Diversity and Diversification** Serge Morand,Boris R.
