Innovative Practices in Teacher Preparation and Graduate-Level Teacher Education Programs Polly, Drew, Putman, Michael, Petty, Teresa M., Good, Amy J., 2017-12-15 Educators play a significant role in the intellectual and social development of children and young adults Thus it is important for next generation teachers to have a strong educational background as it serves as the foundation to their understanding of learning processes leadership and best practices in the field of education Innovative Practices in Teacher Preparation and Graduate Level Teacher Education Programs presents critical and relevant research on methods by which future educators in high level courses are equipped and instructed in order to promote the best experience in academic scholarship Featuring discussion on a diverse assortment of topics such as social justice for English language learners field based teacher education and student satisfaction in graduate programs this publication is directed at academicians students and researchers seeking modern research on the approaches taken by instructors to qualify and engage future educators **You may not enjoy mathematics: (but you do not have to hate it)** Sandoval Amui, 2022-03-11 In writing this book I kept in mind the vast contingent of people who say they hate math In this book I propose some innovative although highly polemic math concepts which will lead us to a different math structure I believe the speculative character of this book makes it quite different from others I am aware this is a bold initiative particularly coming from a person who never had mathematics as his professional field of endeavor Math is an ancient science known as the Queen of Sciences and reputed to be the most difficult discipline in any academic program Just to prepare the reader's mind I say that the new math structure I propose here named the New Math Model will deliver the same useful results as the math structure in use here called the Traditional Math Model does Next comes the inevitable question Why should anyone bother with the inconvenience and trouble to replace an ancient math structure which yields useful results by a new one which delivers the same useful results To that extent I will present sustainable arguments to convince the reader that this new approach is worth the effort Initially I must say that the rationale behind theoretical explanations and the interpretation of results will be significantly different under the New Math Model Additionally any person with a minimal familiarity with math knows that in addition to the useful results the Traditional Math Model yields strange results as imaginary roots of equations equations with strange roots indeterminate forms multiplication and division operations with positive and negative numbers and terms and other oddities not satisfactorily explained Current concepts often accept positive values as equivalent to

absolute values what is not always a valid approach It is undeniable that most students in math classes do not achieve the same performance and grades they do when attending other disciplines In addition to poorer learning it is no secret that most students and people in general dislike the science of math I often hear highly skilled people say they hate math It is an unquestionable fact that most people in their day to day activities only need an understanding of elementary math a knowledge that does not go much further beyond the four basic arithmetic operations This fact should be enough to justify the updating of the math programs in undergraduate schools Complex and abstract matters should be part of advanced math programs I dare to say that some unproven conjectures and unsolved math problems including the so called Millennium Problems math problems the Clay Mathematics Institute offers significant money prizes to whom will solve any of them may be improper statements formulated on invalid premises In other words it is not possible to prove a conjecture or solve a problem if said conjecture or problem does not exist Notwithstanding all these unquestionable odd situations specialists keep adding new theories to the math model in force building a giant structure over a defective foundation Any time they find an inconsistent result they provide strange and clearly unacceptable explanations instead of questioning the fundamentals used We have to accept the obvious conclusion there is something wrong with math That conclusion is the main reason why we should open our minds and consider a new math structure simpler and more consistent math model free of poorly explained odd results less abstract and better aligned with the real world This is an attempt to improve students achievements and people s appreciation when dealing with math matters The introduction of the new math structure fundamentals is the goal I have in mind It may sound too presumptuous I admit However it is simply a well meaning attempt to raise and offer a different view about certain math subjects If you don t try you won t fail If you do try you may fail anyway but you may succeed In the following pages of this book I will present arguments which support my own answer to the question made above as well as the guidelines to follow to achieve that target In addition to questioning some math results and their odd explanations I accepted a different interpretation for some math fundamentals as the concept of numbers and introduced a Fundamental Axiom of Mathematics and an Alternative Cartesian System As a by product I made a clear distinction between positive values and absolute values I also took the opportunity to review other traditional math subjects such as Pythagoras Theorem and Fermat s Conjecture Fermat s Last Theorem after Andrew Wiles two math subjects which in my view we cannot treat as pure algebraic matters I must emphasize that I limited the scope of this book to the analysis of math fundamentals It is not my intention to extend the application of the innovative concepts of the New Math Model to the realm of pure mathematics or to the math segments of applicable math except to a few elementary illustrative examples with the purpose to test their feasibility Nevertheless to the extent I could verify they worked perfectly It is also relevant to emphasize that the introduction of innovative concepts to the science of math will not be sufficient to improve students achievements when attending courses on this science It is also necessary to review and update the didactic approach adopted by academic

programs The present approach in addition to dealing with questionable abstract subjects emphasizes the calculation phase when solving math problems This is a mechanical task that modern machines will perform with incomparable speed and accuracy leaving in a secondary plane the reasoning about the problems what they mean which math concept to use to handle them and how to interpret the results As a tool to serve other areas of the human knowledge math deals with different matters which obey their own laws Under these circumstances and without breaking its own valid rules math must conform to the laws ruling the area it serves For example the letter x in an algebraic expression may mean the unknown value of an equation a geometric property of a geometric figure or the abscissa of a point that belongs to a curve placed in the Cartesian graph as well as a physical property in a scientific formula The same letter in a similar math expression may have different meanings what requires different treatments I suppose teachers do not make this concept clear to their students when teaching math classes Perhaps because they themselves do not have that perception My suggestions will not solve all the inconsistencies we find when using the present math structure but at least will improve the instrument The new math structure will be less abstract more accurate and will not require odd explanations Logical reasoning is the foundation and simplicity is the target of my propositions My suggestion of a simpler math structure may or may not work satisfactorily within reasonable doubt The math structure in use simply does not that is a certainty In writing this book I kept in mind the vast contingent of people who say they hate math If the reader is among those persons who have such unpleasant feeling against math I am convinced that he or she would not hate the math and the teaching approach I propose in this text at least not as much as he or she hates the present math approach You may not enjoy math but you do not have to hate it
