Principles Of Compilers A New Approach To Compilers Including The Algebraic Method:

Principles of Compilers Yunlin Su, Song Y. Yan, 2011-11-22 *Principles of Compilers A New Approach to Compilers Including the Algebraic Method* introduces the ideas of the compilation from the natural intelligence of human beings by comparing similarities and differences between the compilations of natural languages and programming languages. The notation is created to list the source language, target languages and compiler language vividly illustrating the multilevel procedure of the compilation in the process. The book thoroughly explains the LL 1 and LR 1 parsing methods to help readers to understand the how and why. It not only covers established methods used in the development of compilers but also introduces an increasingly important alternative: the algebraic formal method. This book is intended for undergraduates, graduates and researchers in computer science. Professor Yunlin Su is Head of the Research Center of Information Technology, Universitas Ma Chung, Indonesia, and Department of Computer Science, Jinan University, Guangzhou, China. Dr Song Y Yan is a Professor of Computer Science and Mathematics at the Institute for Research in Applicable Computing, University of Bedfordshire, UK, and Visiting Professor at the Massachusetts Institute of Technology and Harvard University, USA.

An Algebraic Approach to Compiler Design Augusto Sampaio, 1997. This book investigates the design of compilers for procedural languages based on the algebraic laws which these languages satisfy. The particular strategy adopted is to reduce an arbitrary source program to a general normal form capable of representing an arbitrary target machine. This is achieved by a series of normal form reduction theorems which are proved algebraically from the more basic laws. The normal form and the related reduction theorems can then be instantiated to design compilers for distinct target machines. This constitutes the main novelty of the author's approach to compilation, together with the fact that the entire process is formalised within a single and uniform semantic framework of a procedural language and its algebraic laws. Furthermore, by mechanising the approach using the OBJ3 term rewriting system, it is shown that a prototype compiler is developed as a byproduct of its own proof of correctness.

Algebraic Methods: Theory, Tools and Applications Martin Wirsing, Jan A. Bergstra, 1989-09-20. *Algebraic Methods in Semantics* M. Nivat, John C. Reynolds, 1985. This book which

contains contributions from leading researchers in France USA and Great Britain gives detailed accounts of a variety of methods for describing the semantics of programming languages i e for attaching to programs mathematical objects that encompass their meaning Consideration is given to both denotational semantics where the meaning of a program is regarded as a function from inputs to outputs and operational semantics where the meaning includes the sequence of states or terms generated internally during the computation The major problems considered include equivalence relations between operational and denotational semantics rules for obtaining optimal computations especially for nondeterministic programs equivalence of programs meaning preserving transformations of programs and program proving by assertions Such problems are discussed for a variety of programming languages and formalisms and a wealth of mathematical tools is described
