Secure Systems Development With Uml:

Secure Systems Development with UML Jan Jürjens, 2005-11-18 Attacks against computer systems can cause considerable economic or physical damage High quality development of security critical systems is difficult mainly because of the conflict between development costs and verifiable correctness Jürjens presents the UML extension UMLsec for secure systems development It uses the standard UML extension mechanisms and can be employed to evaluate UML specifications for vulnerabilities using a formal semantics of a simplified fragment of UML Established rules of security engineering can be encapsulated and hence made available even to developers who are not specialists in security As one example Jürjens uncovers a flaw in the Common Electronic Purse Specification and proposes and verifies a correction With a clear separation between the general description of his approach and its mathematical foundations the book is ideally suited both for researchers and graduate students in UML or formal methods and security and for advanced professionals writing critical applications

Programming Environments, Languages, Security, and Analysis of Systems** Corrado Priami, 2003-11-24 The goal of the IST FET proactive initiative on Global Computing is to train models frameworks methods algorithms to build systems that are exible dependable secure robust and e cient The dominant concerns are those of handling the co ordination and interaction security reliability robustness fa ure modes and control of risk of the entities in the system and the overall design description and performance of the system itself Completely di erent paradigms of computer science may have to be developed to tackle these issues e ectively The research should concentrate on systems having the following characteristics The systems are composed of autonomous computational entities where tivity is not centrally controlled either because global control is impossible or impractical or because the entities are controlled by di erent owners The computational entities are mobile due to the movement of the physical platforms or movement of the entity from one platform to another The con guration varies over time For instance the system is open to the introduction of new computational entities and likewise their deletion The behavior of the entities may vary over time The systems operate with incomplete information about the environment For instance information becomes rapidly out of date and mobility requires information about the environment to be discovered

The ultimate goal of the research action is to provide a solid scientific foundation for the design of such systems and to lay the groundwork for achieving effective principles for building and analyzing such systems
