The efficient delivery of multimedia applications and services over emerging diverse and heterogeneous wireless networks (e.g., 2.5G/3G/4G, Wi-Max, WLANs, PANs, ad hoc, etc.) is a challenging research objective. The research effort for the 3G/4G vision of interworking among heterogeneous technologies to achieve multimedia session continuity, retain multimedia QoS characteristics, and so forth amplifies the need to evaluate the conditions and restrictions under which delivery of such services can be accomplished. Furthermore, there are several research issues such as encoding techniques, cross-layer optimization, error control, security require considerable research effort so that appropriate solutions are designed and developed. The objective of this Special Issue is to present state-of-the-art research and developing activities contributing to all facets of multimedia across heterogeneous emerging wireless technologies (e.g., 4G, ad hoc, Wi-Max, etc.). This Special Issue aims to disseminate state-of-the-art research, development, and novel solutions of multimedia transmission over wireless/mobile-networked multimedia ad hoc systems and technologies.

The first paper entitled "WLAN technologies for audio delivery" by N. Tatlas et al. presents audio delivery over WLAN and investigates the synchronized and robust real-time streaming of multiple audio channels to multipoint receivers, for example, wireless active speakers. A novel synchronization scheme is also introduced, allowing optimized playback for multiple receivers. The perceptual audio performance is assessed for both stereo and 5-channel applications based on either PCM or compressed audio signals.

The second paper entitled "Efficient TTI for 3G multimedia applications" by C. Chaikalis addresses time transmission interval (TTI), which is a very important task for implementing optimum UMTS turbo coding in flat Rayleigh fading environment. Different multimedia scenarios are investigated

by C. Chaikalis, using maximum UMTS frame length. It is shown that different operating environments require appropriate TTI in terms of BER performance for a variety of data rates.

The impact of data transfer service, multimedia streaming service, web service, and traffic load on speech quality in an environment of WLANs (IEEE 802.11) has been examined at the third paper entitled "Impact of background traffic on speech quality in VoWLAN" by R. Poeta et al. In their paper, a new method for improving the detection of the critical conditions in wireless networks from the speech quality point of view is presented.

The fourth paper entitled "Fuzzy logic control of adaptive ARQ for video distribution over a Bluetooth wireless link" by R. Razavi et al. considers adaptive ARQ, suitable for video transmission over Bluetooth links. The authors present a fuzzy logic control of ARQ, based on send buffer fullness and the head-of-line packet's deadline. The scheme considers both the delay constraints of the video stream and at the same time avoids send buffer overflow. Tests explore a variety of Bluetooth send buffer sizes and channel conditions.

The fifth paper entitled "Utilizing cross-layer information to improve performance in JPEG2000 decoding" by H. Persson et al. focuses on wireless multimedia communication and investigates the scenario of how the cross-layer information can be used to improve the performance in image quality at the application layer using the JPEG2000 standard.

The sixth paper entitled "Joint optimization in UMTS-based video transmission" by A. Zsiros et al. presents a new software platform to enable demonstration and capacity testing within the framework of IST-PHOENIX project. The developed platform simulates a joint optimized UMTS video transmission.
