those important structural probes electron microscopy with the associated image analysis methods and X ray diffraction have provided a wealth of information about the arrangements of the constituent proteins in a variety of muscle types But despite all this the answer to the question How does muscle work is still uncertain especially with regard to the molecular events by which force is actually generated and the question remains one of the major unsolved problems in biology With this problem in mind this book has been written to collect together the available evidence on the structures of the muscle filaments and on their arrangements in different muscle cells to extract the common structural features of these cells and thus to attempt to define a possible series of mechanical steps that will describe at molecular resolution the process by which force is generated The book cannot be considered to be an introductory text in fact it presents a very detailed account of muscle structure as gleaned mainly from electron microscopy and X ray diffraction **Nerve Repair** Thomas M.

Brushart, 2011-02-15 Nerve Repair is a historically based translational review of the clinical and basic science relevant to nerve repair and regeneration Essential reading for a wide range of professionals it summarizes pertinent research for the clinician and the clinical aspects of nerve repair for the scientist
