9. Flow Rate Calculation for Less than Half Full Flow

The cross-sectional area, A ; wetted perimeter, P ; and hydraulic radius, R_h , can be calculated for known pipe diameter and depth of flow using the equations that were presented and discussed in Section 5. The appropriate equation from those presented in the previous section can be used to calculate the Manning roughness coefficient, n , for given n_{full} , y , and D . These values together with the pipe slope, S , can be used in the Manning equation to calculate the flow rate and velocity, as illustrated in the following example.

Example #6: Calculate the flow rate and average velocity for the 4-inch deep flow in the 12-inch diameter corrugated metal pipe from Example #5, if the pipe slope is 0.0085.
