Natural Language Parsing Systems Symbolic Computation:

Natural Language Parsing Systems Leonard Bolc, 2012-12-06 Up to now there has been no scientific publication on natural language research that presents a broad and complex description of the current problems of parsing in the context of Artificial Intelligence. However, there are many interesting results from this domain appearing mainly in numerous articles published in professional journals. In view of this situation, the objective of this book is to enable scientists from different countries to present the results of their research on natural language parsing in the form of more detailed papers than would be possible in professional journals. This book thus provides a collection of studies written by well-known scientists whose earlier publications have greatly contributed to the development of research on natural language parsing. Jaime G. Carbonell and Philip J. Hayes present in their paper *Robust Parsing Using Multiple Construction Specific Strategies* two small experimental parsers implemented to illustrate the advantages of a multi-strategy approach to parsers with strategies selected according to the type of construction being parsed at any given time. This presentation is followed by the description of a parsing algorithm integrating some of the best features of the two smaller parsers including case frame instantiation and partial pattern matching strategies.

Natural Language Processing and Computational Linguistics Mohamed Zakaria Kurdi, 2016-08-17 Natural language processing (NLP) is a scientific discipline which is found at the interface of computer science, artificial intelligence, and cognitive psychology. Providing an overview of international work in this interdisciplinary field, this book gives the reader a panoramic view of both early and current research in NLP. Carefully chosen multilingual examples present the state of the art of a mature field which is in a constant state of evolution. In four chapters, this book presents the fundamental concepts of phonetics and phonology and the two most important applications in the field of speech processing: recognition and synthesis. Also presented are the fundamental concepts of corpus linguistics and the basic concepts of morphology and its NLP applications such as stemming and part of speech tagging. The fundamental notions and the most important syntactic theories are presented as well as the different approaches to syntactic parsing with reference to cognitive models, algorithms, and computer applications.

Representation Learning for Natural Language Processing Zhiyuan Liu, Yankai Lin, Maosong Sun, 2023-08-23 This book provides an overview of the recent advances in representation learning theory, algorithms, and applications for natural language processing (NLP) ranging from word embeddings to pre-trained language models. It is divided into four parts. Part I presents the representation learning techniques for multiple language entries including words, sentences, and documents as well as pre-training techniques. Part II then introduces the related representation techniques to NLP including graphs, cross-modal entries, and robustness. Part III then introduces the representation techniques for the knowledge that are closely related to NLP including entity-based world knowledge, sememe-based linguistic knowledge, legal domain knowledge, and biomedical domain knowledge. Lastly, Part IV discusses the remaining challenges and future research directions. The theories and algorithms of

representation learning presented can also benefit other related domains such as machine learning social network analysis semantic Web information retrieval data mining and computational biology This book is intended for advanced undergraduate and graduate students post doctoral fellows researchers lecturers and industrial engineers as well as anyone interested in representation learning and natural language processing As compared to the first edition the second edition 1 provides a more detailed introduction to representation learning in Chapter 1 2 adds four new chapters to introduce pre trained language models robust representation learning legal knowledge representation learning and biomedical knowledge representation learning 3 updates recent advances in representation learning in all chapters and 4 corrects some errors in the first edition The new contents will be approximately 50% compared to the first edition This is an open access book

Computation of Language

Roland Hausser,2012-12-06 The study of linguistics has been forever changed by the advent of the computer Not only does the machine permit the processing of enormous quantities of text thereby securing a better empirical foundation for conclusions but also since it is a modelling device the machine allows the implementation of theories of grammar and other kinds of language processing Models can have very unexpected properties both good and bad and it is only through extensive tests that the value of a model can be properly assessed The computer revolution has been going on for many years and its importance for linguistics was recognized early on but the more recent spread of personal workstations has made it a reality that can no longer be ignored by anyone in the subject The present essay in particular could never have been written without the aid of the computer I know personally from conversations and consultations with the author over many months how the book has changed If he did not have at his command a powerful typesetting program he would not have been able to see how his writing looked and exactly how it had to be revised and amplified Even more significant for the evolution of the linguistic theory is the easy testing of examples made possible by the implementation of the parser and the computer held lexicon Indeed the rule set and lexicon grew substantially after the successes of the early implementations created the desire to incorporate more linguistic phenomena
