Peritoneal Carcinomatosis Principles Of Management Cancer Treatment And Research:

Peritoneal Carcinomatosis: Principles of Management Paul H. Sugarbaker, 2012-12-06 Paul Sugarbaker and his colleagues have persevered in the study and treatment of peritoneal carcinomatosis. The peritoneal cavity has many unique and incompletely appreciated properties. These properties coupled with the biologic behavior of many cancers results in the seeding and growth of these cancers on the peritoneum. Many of these cancers remain localized to the peritoneum only never metastasizing to other sites. One possible reason for this may be the obstruction of the afferent lymphatics on the undersurface of the diaphragm. The mucopolysaccharides produced by many of these neoplasms are probably viscous enough to obstruct these lymphatics leading to the syndrome of pseudomyxoma peritonei. Many of the neoplasms taking residence on the peritoneum have extremely long cell cycle times and are resistant to radiotherapy and many chemotherapeutic agents. However much can be done for these patients: resection of primary cancers, omentectomies to reduce ascites formation, management of recurrent ascites, management of intestinal obstruction, nutritional care and hopefully intraperitoneal chemotherapy. We have reviewed many of these problems in the past 17. Dr Sugarbaker and his colleagues have organized the current state of knowledge and technology for continuing use. The book provides a basis for thoughtful prospective research planning. John S. Spratt, M.D., F.A.C.S., Professor of Surgery, The James Graham Brown Cancer Center, University of Louisville, Louisville, Kentucky. References: 1. Long RTL, Spratt JS, Dowling E. Sugarbaker, 2012-12-06 Peritoneal carcinomatosis dominates the clinical picture of many patients with gastrointestinal gynecological and urological cancers For many of them its devastating effects contribute directly to their death Most clinicians consider peritoneal carcinomatosis an incurable metastatic disease and give palliative treatment restricted to limited surgery and systemic chemotherapy Contrary to this view Paul Sugarbaker and his colleagues base their approach on the concept that peritoneal carcinomatosis represents regional tumor spread similar in its impact on treatment and prognosis to that of lymph node metastases in other malignancies This concept emphasises the value of regional tumor control as a potentially curative measure In this book the combination of aggressive cytoreduction and intraperitoneal chemotherapy to control peritoneal carcinomatosis is extensively explored Basic to this approach is the observation that most cancer cells show only relative resistance against commonly available drugs which can be overcome by a sufficient increase of drug concentrations in tumor tissue After intraperitoneal delivery drugs will reach high tissue concentrations in the superficial few cell layers while plasma concentrations will remain below toxic levels Patients with only limited residual tumor at the peritoneal surface after cytoreduction may therefore benefit from intraperitoneal chemotherapy
