## Reference Guide

### Code Layout

1. Brace and parenthesize in RAR style.
2. Separate your control keywords from the following opening bracket.
3. Don't separate subroutines or variable names from the following opening bracket.
4. Don't use unnecessary parentheses for routine and temporary handles.
5. Separate complex keys or indices from their surrounding brackets.
6. Use whitespace to help binary operators stand out from their operands.
7. Place a semicolon after every statement.
8. Place a colon after every value in a multiline list.
9. Use 78-column lines.
10. Use four-column indentation levels.
11. Indent with spaces, not tabs.
12. Never place two statements on the same line.
13. Code in paragraphs.
14. Don't enable an `else`.
15. Align corresponding items vertically.
16. Break long expressions before an operator.
17. Factor out long expressions in the middle of statements.
18. Always break a long expression at the opening of the lowest possible precedence.
19. Break long assignments before the assignment operator.
20. Format cascaded ternary operators in columns.
21. Parenthesize long lists.
22. Enforce your chosen layout style mechanically.

### Naming Conventions

23. Use grammatical templates when naming identifiers.
24. Name handles after their associated box.
25. Mark variables that store references with a `_ref` suffix.
26. Name arrays in the plural and handles in the singular.
27. Use underscores to separate words in multimed identifiers.
28. Distinguish different program components by case.
29. Note down the prefix.
30. Abbreviate only when the meaning remains unambiguous.
31. Avoid using inherently ambiguous words in names.
32. Prefix for internal use only subroutines with an underscore.

### Values and Expressions

33. Use interpolating string delimiters only for strings that actually interpolate.
34. Don't use `""` or `''` for an empty string.
35. Don't write one-character strings in visually ambiguous ways.
36. Use named character escapes instead of numeric escapes.
37. Use named constants, but don't use `constant`.
38. Don't pad decimal numbers with leading zeros.

39. Use underscores to improve the readability of long numbers.
40. Lay out multiline strings over multiple lines.
41. Use a heredoc when a multiline string exceeds two lines.
42. Use a `heredoc` when a heredoc would compress your indentation.
43. Make every heredoc terminate a single uppercase identifier with a standard prefix.
44. When introducing a heredoc, quote the terminator.
45. Don't use backslashes.
46. Reserve `or` for pairs.
47. Don't use commas to sequence statements.
48. Don't mix high- and low-prioridade handles.
49. Parenthesize every `or` list.
50. Use table-lookup to test for membership in lists of strings, not `any()` for membership of lists of anything else.

### Variables

51. Avoid using mathematical variables.
52. Don't use package variables in your own development.
53. If you're forced to modify a package variable, *localize* it.
54. Initialize any variable you *localize*.
55. *use English* for the few familiar punctuation variables.
56. If you're forced to modify a punctuation variable, *localize* it.
57. Don't use the same magic variables.
58. Beware of any modification via `$_`.
59. Use negative indices when counting from the end of an array.
60. Take advantage of both and some slicing.
61. Use a tabular layout for slices.
62. Factor large key or index lists out of their slices.

### Control Structures

63. Use block `if`, not prefix `if`.
64. Reserve prefix `if` for flow-of-control statements.
65. Don't use prefix `unless`, `for`, `while`, or `until`.
66. Don't use `unless` or `until` at all.
67. Avoid C-style `for` statements.
68. Avoid subscripting arrays or hashes within loops.
69. Never subscript more than once in a loop.
70. Use named literals as explicit `for` loop iterators.
71. Always declare a `for` loop iterator variable with `my`.
72. Use `map` instead of `for` when generating new lists from old.
73. Use `grep` and `first` instead of `for` when searching for values in a list.
74. Use `for` instead of `map` when transforming a list in place.
75. Use a subroutine call to factor out complex list transformations.
76. Never modify `$_` in a list function.
77. Avoid cascading `if`.
78. Use table-lookup in preference to cascaded equality tests.
79. When producing a value, use tabular constructs.
80. Don't use `do`, `while` loops.
81. Repeat as many iterations as possible, as early as possible.
82. Don't control loop structures just to concatenate control.
83. Use `for` and `redo` instead of an irregularly created `while`.
84. Label every loop that is exited explicitly, and use the label with `next`, `last`, or `redo`.

### Documentation

85. Distinguish user documentation from technical documentation.
86. Create standard POD templates for modules and applications.
87. Extend and customize your standard POD templates.
88. Put user documentation in source files.
89. Keep all user documentation in a single place within your source file.
90. Place POD as close as possible to the end of the file.
91. Subdivide your technical documentation appropriately.
92. Use block comments for major comments.
93. Use full-line comments to explain the algorithm.
94. Use end-of-line comments to point out subtleties and address.
95. Comment anything that has puzzled or misled you.
96. Consider whether it's better to write than to comment.
97. Use `ivariable` POD sections for longer technical discussions.
98. Check the spelling, syntax, and sanity of your documentation.

### Built-in Functions

99. Don't recompute sort keys inside a `sort`.
100. Use `reverse` to reverse a list.
101. Use scalar `reverse` to reverse a scalar.
102. Use `unpack` to extract fixed-width fields.
103. Use `split` to extract simple variable-width fields.
104. Use `unpack` to extract complex variable-width fields.
105. Avoid string `eval`.
106. Consider building your sorting routine with `sort` + `block`.
107. Use `long` `sublist` instead of `index` `sublist`.
108. Make appropriate use of brace values.
109. Use `glob`, not `q*`.
110. Avoid a new `select` for non-integer sleeps.
111. Always use a block with a `map` and `grep`.
112. Use the `from-handle` handle.

### Subroutines

113. Call subroutines with parentheses but without a leading `&`.
114. Don't give subroutines the same names as built-in functions.
115. Always inspect `$_` first.
116. Use a block of nested arguments for any subroutine that has more than three parameters.
117. Use `definedness` or `existence` tests for missing arguments.
118. Resolve any default argument values as soon as `$_` is inspected.
119. Always return scalar in scalar returns.
120. Make list-returning subroutines return the 'ritual' value in scalar context.
121. When there is no 'ritual' scalar context return value, consider `undef` or `chance` instead.
122. Don't use subroutine prototypes.
123. Always return via an explicit `return`.
124. Use a bare `return` to return failure.

### IO

125. Don't use `foreach` filehandles.
126. Use indirect filehandles.
127. If you have to use a package filehandle, *localize* it first.

**Practices** Damian Conway, 2014 A decade after *Perl Best Practices* was published tens of thousands of Perl developers continue to read debate and adopt most of the recommendations in the book But rather than deliver a fixed and eternal set of rules author Damian Conway wanted to stimulate a mindset of continual re-evaluation of all Perl coding techniques and tools Resource description page **Perl Best Practices** Damian Conway, 2007-09-05 Many programmers code by instinct relying on convenient habits or a style they picked up early on They aren't conscious of all the choices they make like how they format their source the names they use for variables or the kinds of loops they use They're focused entirely on problems they're solving solutions they're creating and algorithms they're implementing So they write code in the way that seems natural that happens intuitively and that feels good But if you're serious about your profession intuition isn't enough *Perl Best Practices* author Damian Conway explains that rules conventions standards and practices not only help programmers

communicate and coordinate with one another they also provide a reliable framework for thinking about problems and a common language for expressing solutions This is especially critical in Perl because the language is designed to offer many ways to accomplish the same task and consequently it supports many incompatible dialects With a good dose of Aussie humor Dr Conway familiar to many in the Perl community offers 256 guidelines on the art of coding to help you write better Perl code in fact the best Perl code you possibly can The guidelines cover code layout naming conventions choice of data and control structures program decomposition interface design and implementation modularity object orientation error handling testing and debugging They re designed to work together to produce code that is clear robust efficient maintainable and concise but Dr Conway doesn t pretend that this is the one true universal and unequivocal set of best practices Instead Perl Best Practices offers coherent and widely applicable suggestions based on real world experience of how code is actually written rather than on someone s ivory tower theories on how software ought to be created Most of all Perl Best Practices offers guidelines that actually work and that many developers around the world are already using Much like Perl itself these guidelines are about helping you to get your job done without getting in the way Praise for Perl Best Practices from Perl community members As a manager of a large Perl project I d ensure that every member of my team has a copy of Perl Best Practices on their desk and use it as the basis for an in house style guide Randal Schwartz There are no more excuses for writing bad Perl programs All levels of Perl programmer will be more productive after reading this book Peter Scott Perl Best Practices will be the next big important book in the evolution of Perl The ideas and practices Damian lays down will help bring Perl out from under the embarrassing heading of scripting languages Many of us have known Perl is a real programming language worthy of all the tasks normally delegated to Java and C With Perl Best Practices Damian shows specifically how and why so everyone else can see too Andy Lester Damian s done what many thought impossible show how to build large maintainable Perl applications while still letting Perl be the powerful expressive language that programmers have loved for years Bill Odom Finally a means to bring lasting order to the process and product of real Perl development teams Andrew Sundstrom Perl Best Practices provides a valuable education in how to write robust maintainable Perl and is a definitive citation source when coaching other programmers Bennett Todd I ve been teaching Perl for years and find the same question keeps being asked Where can I find a reference for writing reusable maintainable Perl code Finally I have a decent answer Paul Fenwick At last a well researched well thought out comprehensive guide to Perl style Instead of each of us developing our own we can learn good practices from one of Perl s most prolific and experienced authors I recommend this book to anyone who prefers getting on with the job rather than going back and fixing errors caused by syntax and poor style issues Jacinta Richardson If you care about programming in any language read this book Even if you don t intend to follow all of the practices thinking through your style will improve it Steven Lembark The Perl community s best author is back with another outstanding book There has never been a comprehensive reference on high quality Perl coding and style
