Closteroviridae Ricardo Flores, Pedro

Moreno, Bryce Falk, Giovanni P. Martelli, William O. Dawson, 2014-06-06 Plant viruses grouped within this family have remarkable properties prominent among which is their genomic size Citrus tristeza virus CTV has the largest 19.3 kb genome reported for a plant monopartite single stranded RNA virus. Virions are filamentous and typically flexuous particles approximately 12 nm in diameter and 650 to 2000 nm in length with a unique bipolar rattlesnake morphology. The major coat protein CP encapsidates most of the genomic RNA with a minor CP CPm coating a small 5' terminal fragment, virion tail, and other viral encoded proteins being also incorporated to this tail. The genome is monopartite. Genus Closterovirus type member Beet yellows virus and genus Ampelovirus type member Grapevine leafroll associated virus 3 or bipartite genus Crinivirus type member Lettuce infectious yellows virus with at least one example of tripartite genome. The genomic RNA or RNA1 in criniviruses directs translation of the two 5' proximal ORFs via a peculiar ribosomal frameshift mechanism and proteolytic processing that encode replication related components with the 3' proximal ORFs encoding proteins expressed from 3' coterminal subgenomic RNAs. A genomic signature of members of the family Closteroviridae is the presence of a five gene block of proteins involved in virion assembly and movement that in addition to the CP and CPm includes a small transmembrane protein, a homologue of the HSP70 class of heat shock proteins, and a diverged CP. Members of this family encode suppressors of RNA silencing differing in number up to three in CTV and in mode of action intracellular, intercellular, or both. In this same context Sweet potato chlorotic stunt virus codes for a singular suppressor, an RNase III that catalyzes cleavage of the small interfering RNAs mediating RNA silencing. Host range is usually narrow and in order to expand it some members of the family illustrated by the case of CTV have evolved by acquiring multiple non conserved genes. Virion accumulation is restricted to the phloem with aphids, mealybugs, and whiteflies depending on the genus operating as natural vectors. Disease symptoms may be expressed in leaves, fruits, and trunk of the woody hosts.
