Chapter – 12

Q.1: Repulsion is the sure test of electrification. Explain?

Ans: Electrostatic attraction is observed between oppositely charged bodies and also between a charged (+ve or -ve) and an uncharged body. But, however, only two charges of the same kind (both +ve or both -ve) can repel each other. Hence, repulsion is the sure test of electrification.

Q.2: Will a solid metal sphere hold a large electric charge then a hollow sphere of the same diameter? Where the charge does reside in each case?

Ans: A solid metal sphere will hold the same amount of charge as is held by a hollow sphere of the same diameter. This is due to the fact that any excess electric charge resides only on the outer surface of a conductor.

Q.3: Explain why is it so much easier to remove an electron from an atom of large atomic mass than it is to remove a proton?

Ans: In an atom of large atomic mass, the number of both protons and electrons is large. This big atom contains many orbits (or shells). So it is easier to remove an electron from its outermost orbit. The heavy positive nucleus exerts weaker coulomb attraction force on it as compared to an electron in the innermost shell (e.g. K shell). However, protons are in the nuclei which are held very strongly by strong nuclear forces.

Q.4: Why is it not correct to say that potential-difference is the work done in moving a unit positive charge between the points concerned?

Ans: The potential difference is the increase in electric potential energy (or work) per unit charge. So, if a small positive charge (q_0) is moved against the electric field between the two points, then the work divided by the amount of charge (w/q_0) gives the p.d.

Q.5: Why is it logical say that the potential of an earth connected object is zero? What can be said about the charge on the earth?

Ans: Practically, the earth is taken to be at zero potential. If a charged body is connected to the earth by a conductor, electron flow takes place such that the charge of the body is neutralized.

The earth is a reason sly good conductor. It is a huge neutral body. It is considered as an Infinite sink to which electrons can easily migrate without changing its potential

Q.6: Can an electric potential exist at n point in a region where the field is zero? Can the potential be zero at a place where the electric field intensity is not zero? Give example to illustrate your reasoning.

Ans: Yes, Electric potential can exist where the electric intensity is zero. The electric charge resides on the outer surface of a hollow sphere. At all points inside the sphere, the electric field intensity is zero. Otherwise the field lines would link the charges of opposite sign in

Methods for Solving Mathematical Physics Problems Valeriĭ Ivanovich Agoshkov, P. B. Dubovski, V. P. Shutaiyev, 2006 The aim of the book is to present to a wide range of readers students postgraduates scientists engineers etc basic information on one of the directions of mathematics methods for solving mathematical physics problems The authors have tried to select for the book methods that have become classical and generally accepted However some of the current versions of these methods may be missing from the book because they require special knowledge The book is of the handbook teaching type On the one hand the book describes the main definitions the concepts of the examined methods and approaches used in them and also the results and claims obtained in every specific case On the other hand proofs of the majority of these results are not presented and they are given only in the simplest methodological cases Another special feature of the book is the inclusion of many examples of application of the methods for solving specific mathematical physics problems of applied nature used in various areas of science and social activity such as power engineering environmental protection hydrodynamics elasticity theory etc This should provide additional information on possible applications of these methods To provide complete information the book includes a chapter dealing with the main problems of mathematical physics together with the results obtained in functional analysis and boundary value theory for equations with partial derivatives
