Modern Protective Structures Theodor Krauthammer, 2008-02-01 In today's world reasonably predictable military operations have been replaced by low intensity conflicts less predictable terrorist activities carried out by determined individuals or small groups that possess a wide range of backgrounds and capabilities. Because of the threats posed by this evolving type of warfare civil engineers and emergency personnel face new challenges in designing facilities to protect lives and property and in conducting effective rescue operations and forensic investigations. Addressing these needs Modern Protective Structures develops realistic guidelines for the analysis design assessment retrofit and research of protected facilities. After introducing a comprehensive risk management approach the author provides a general background on explosive devices and their capabilities as well as explosive effects and the processes that generate them. He then discusses the effects of conventional and nuclear explosions. The book subsequently considers the significant design differences between conventional and nuclear loads and between existing design procedures and state of the art information from recent research. It also summarizes existing blast resistant design approaches and describes the dynamic responses of structural systems to blasts shocks and impacts. Additional coverage includes the behavior of specific structural connections the traditional concept of P I diagrams and progressive collapse. The book concludes with a systematic and balanced protective design approach. Tackling the analytical design assessment and hazard mitigation issues associated with short duration dynamic loads this book examines how impulsive loads affect various types of buildings and facilities. It provides the necessary material to help ensure the safety of persons assets and projects.

Progressive Collapse Analysis of Concrete-filled Steel Tubular Structures Man Xu,Shan Gao,Jing-xuan Wang,2024-09-21 Since the notorious terrorist attack of the World Trade Center in 2001 researchers and engineers have been forced to review the existing research works and standards in resisting the progressive collapse of structures From then on the design of structure against progressive collapse has tended toward quantitative design rather than qualitative design The collapse of the COVID 19 epidemic isolation hotel in Quanzhou China in 2020 and the vertical collapse of a 12 story apartment in Florida United States in 2021 have aroused an upsurge of the research on progressive collapse More experimental and theoretical works have been focused on this area This book addresses this issue and provides a valuable reference for the progressive collapse analysis and design of building structures Reviews latest references systematically in terms of experiments simulation and theory Introduces different test equipment used in the tests of progressive collapse and also modeling techniques used in the numerical studies of progressive collapse Includes performance prediction theories used in the analysis of progressive collapse Comprises considerable information on the tests and simulation and theoretical studies collected from the authors research in the last 10 years
