Ebis, Oday A. Hassen, Saad M. Darwish,2023-01-01 Due to the Internet's explosive growth network security is now a major concern as a result tracking network traffic is essential for a variety of uses including improving system efficiency fixing bugs in the network and keeping sensitive data secure Firewalls are a crucial component of enterprise wide security architectures because they protect individual networks from intrusion The efficiency of a firewall can be negatively impacted by issues with its design configuration monitoring and administration Recent firewall security methods do not have the rigor to manage the vagueness that comes with filtering packets from the exterior Knowledge representation and reasoning are two areas where fuzzy Petri nets FPNs receive extensive usage as a modeling tool Despite their widespread success FPNs limitations in the security engineering field stem from the fact that it is difficult to represent different kinds of uncertainty This article details the construction of a novel packet filtering firewall model that addresses the limitations of current FPN based filtering methods The primary contribution is to employ Simplified Neutrosophic Petri nets SNPNs as a tool for modeling discrete event systems in the area of firewall packet filtering that are characterized by imprecise knowledge Because of SNPNs symbolic ability the packet filtration model can be quickly and easily established examined enhanced and maintained Based on the idea that the ambiguity of a packet s movement can be described by if then fuzzy production rules realized by the truth membership function the indeterminacy membership function and the falsity membership functional we adopt the neutrosophic logic for modelling PN transition objects In addition we simulate the dynamic behavior of the tracking system in light of the ambiguity inherent in packet filtering by presenting a two level filtering method to improve the ranking of the
