Selected Readings In Chemical Kinetics:

Selected Readings in Chemical Kinetics Margaret Helen Baca, Keith James Laidler, 1967 **Selected Readings in Chemical Kinetics** Margaret H. Back, Keith J. Laidler, 2013-09-11 Selected Readings in Chemical Kinetics covers excerpts from 12 papers in the field of general and gas phase kinetics The book discusses papers on the laws of connexion between the conditions of a chemical change and its amount on the reaction velocity of the inversion of the cane sugar by acids and the calculation in absolute measure of velocity constants and equilibrium constants in gaseous systems The text then tackles papers on simple gas reactions on the absolute rate of reactions in condensed phases on the radiation theory of chemical action and on the theory of unimolecular reactions Papers on the theories of unimolecular reactions at low pressures on the reaction between hydrogen and bromine and on the oxidation of phosphorus vapor at low pressures are also considered The book further describes papers on the thermal decomposition of organic compounds from the standpoint of free radicals as well as on a single chain mechanism for the thermal decomposition of hydrocarbons The book will be invaluable to students of chemical kinetics Selected Readings in Chemical Kinetics Chemical Kinetics Keith James Laidler, 1967 *Selected readings in chemical kinetics* Margaret H. Back, 1967 **Femtochemistry** Ahmed H. Zewail, 1994 These two volumes on Femtochemistry present a timely contribution to a field central to the understanding of the dynamics of the chemical bond This century has witnessed great strides in time and space resolutions down to the atomic scale providing chemists biologists and physicists with unprecedented opportunities for seeing microscopic structures and dynamics Femtochemistry is concerned with the time resolution of the most elementary motions of atoms during chemical change bond breaking and bond making on the femtosecond 10⁻¹⁵ second time scale This atomic scale of time resolution has now reached the ultimate for the chemical bond and as Lord George Porter puts it chemists are near the end of the race against time These two volumes cover the general concepts techniques and applications of femtochemistry Professor Ahmed Zewail who has made the pioneering contributions in this field has from over 250 publications selected the articles for this anthology These volumes begin with a commentary and a historical chronology of the milestones He then presents a broad perspective of the current state of knowledge in femtochemistry by researchers around the world and discusses possible new directions In the words of a colleague it is a must on the reading list for all of my students all readers will find this to be an informative and valuable overview The introductory articles in Volume I provide reviews for both the non experts as well as for experts in the field This is followed by papers on the basic concepts For applications elementary reactions are studied first and then complex reactions Volume I is complete with studies of solvation dynamics non reactive systems ultrafast electron diffraction and the control of chemical reactions Volume II continues with reaction rates the concept of elementary intramolecular vibrational energy redistribution IVR and the phenomena of rotational coherence which has become a powerful tool for the determination of molecular structure via time resolution The second volume ends with an extensive list of references

according to topics based on work by Professor Zewail and his group at Caltech These collected works by Professor Zewail will certainly be indispensable to both experts and beginners in the field The author is known for his clarity and for his creative and systematic contributions These volumes will be of interest and should prove useful to chemists biologists and physicists As noted by Professor J Manz Berlin and Professor A W Castleman Jr Penn State femtochemistry is yielding exciting new discoveries from analysis to control of chemical reactions with applications in many domains of chemistry and related fields e g physical organic and inorganic chemistry surface science molecular biology etc

Stochastic Methods in Neuroscience Carlo Laing, Gabriel J Lord, 2009-09-24 Great interest is now being shown in computational and mathematical neuroscience fuelled in part by the rise in computing power the ability to record large amounts of neurophysiological data and advances in stochastic analysis These techniques are leading to biophysically more realistic models It has also become clear that both neuroscientists and mathematicians profit from collaborations in this exciting research area Graduates and researchers in computational neuroscience and stochastic systems and neuroscientists seeking to learn more about recent advances in the modelling and analysis of noisy neural systems will benefit from this comprehensive overview The series of self contained chapters each written by experts in their field covers key topics such as Markov chain models for ion channel release stochastically forced single neurons and populations of neurons statistical methods for parameter estimation and the numerical approximation of these stochastic models Each chapter gives an overview of a particular topic including its history important results in the area and future challenges and the text comes complete with a jargon busting index of acronyms to allow readers to familiarize themselves with the language used

Surface Chemistry of Froth Flotation S. Ramachandra

Rao, 2013-06-29 The technology of froth flotation invented in the early 20 century was first used for the concentration of sulfide minerals. Since then it has been applied for the processing of many nonsulfide ores as well including oxides, carbonates, silicates, soluble minerals like halite and sylvite and energy minerals like coal and bitumen. In recent years it has been used for several nonmineral applications such as waste water treatment, deinking of paper for recycling and resource recovery from industrial wastes. The technology continues to grow with new applications reported every year. Flotation is based on chemical phenomena occurring at the interfaces solid water and air water. Surface Chemistry principles have played a significant role in the development of flotation technology. Knowledge of aqueous solution chemistry and electrochemistry has added to our understanding of the reactions in flotation systems. Professor Jan Leja's book has well served researchers and students as they tried to understand the chemistry of flotation and it is a significant contribution to the advancement of knowledge. However, since the book was first published, new research techniques and ever growing information have made an update necessary. The revised edition compiled by Dr S R Rao has brought together fundamental aspects of the chemistry of flotation and how they apply to practical systems. It should serve all who are working in the area of flotation and interested in exploring new applications of flotation technology.

The Union of Chemistry and Physics Hinne Hettema, 2017-08-01 This monograph deals with the interrelationship between chemistry and physics and especially the role played by quantum chemistry as a theory in between these two disciplines. The author uses a structuralist approach to explore the overlap between the two sciences looking at their theoretical and ontological borrowings as well as their continuity. The starting point of this book is that there is at least a form of unity between chemistry and physics where the reduction relation is conceived as a special case of this unity. However, matters are never concluded so simply within philosophy of chemistry as significant problems exist around a number of core chemical ideas. Specifically, one cannot take the obvious success of quantum theories as outright support for a reductive relationship. Instead, in the context of a suitably adapted Nagelian framework for reduction, modern chemistry's relationship to physics is constitutive. The results provided by quantum chemistry in particular have significant consequences for chemical ontology. This book is ideal for students, scholars and academics from the field of Philosophy of Science and particularly for those with an interest in Philosophy of Chemistry and Physics.

Statistical Thermodynamics of Nonequilibrium Processes Joel Keizer, 2012-12-06 The structure of the theory of thermodynamics has changed enormously since its inception in the middle of the nineteenth century. Shortly after Thomson and Clausius enunciated their versions of the Second Law, Clausius, Maxwell and Boltzmann began actively pursuing the molecular basis of thermodynamics work that culminated in the Boltzmann equation and the theory of transport processes in dilute gases. Much later, Onsager undertook the elucidation of the symmetry of transport coefficients and thereby established himself as the father of the theory of nonequilibrium thermodynamics. Combining the statistical ideas of Gibbs and Langevin with the phenomenological transport equations, Onsager and others went on to develop a consistent statistical theory of irreversible

processes The power of that theory is in its ability to relate measurable quantities such as transport coefficients and thermodynamic derivatives to the results of experimental measurements As powerful as that theory is it is linear and limited in validity to a neighborhood of equilibrium In recent years it has been possible to extend the statistical theory of nonequilibrium processes to include nonlinear effects The modern theory as expounded in this book is applicable to a wide variety of systems both close to and far from equilibrium The theory is based on the notion of elementary molecular processes which manifest themselves as random changes in the extensive variables characterizing a system The theory has a hierarchical character and thus can be applied at various levels of molecular detail
