boundary layer potentials in the study of elliptic boundary value problems with boundary data in a multitude of function spaces Many significant new results are explored in detail with complete proofs emphasizing and elaborating on the link between the geometric measure theoretic features of an underlying surface and the functional analytic properties of singular integral operators defined on it Graduate students researchers and professionals interested in a modern account of the topic of singular integral operators and boundary value problems as well as those more generally interested in harmonic analysis PDEs and geometric analysis will find this text to be a valuable addition to the mathematical literature

From Real to Complex Analysis R. H. Dyer, D. E. Edmunds, 2014-05-14 The purpose of this book is to provide an integrated course in real and complex analysis for those who have already taken a preliminary course in real analysis It particularly emphasises the interplay between analysis and topology Beginning with the theory of the Riemann integral and its improper extension on the real line the fundamentals of metric spaces are then developed with special attention being paid to connectedness simple connectedness and various forms of homotopy The final chapter develops the theory of complex analysis in which emphasis is placed on the argument the winding number and a general homology version of Cauchy's theorem which is proved using the approach due to Dixon Special features are the inclusion of proofs of Montel's theorem the Riemann mapping theorem and the Jordan curve theorem that arise naturally from the earlier development Extensive exercises are included in each of the chapters detailed solutions of the majority of which are given at the end From Real to Complex Analysis is aimed at senior undergraduates and beginning graduate students in mathematics It offers a sound grounding in analysis in particular it gives a solid base in complex analysis from which progress to more advanced topics may be made
