

Sectors – ARC LENGTH Example 2

L = Length of Arc around Pizza

We only have 300° out of the full 360° of the circle.

This fraction is 300 / 360

The large remaining part of this circle is called a "MAJOR Sector".

All the way around a Circle is the "Circumference" of

$$C = \pi \times R \times 2 \quad \text{where } \pi = 3.1416$$

$$L = 300 / 360 \text{ of a full circle}$$

$$L = 300/360 \times (\pi \times R \times 2)$$

$$L = 0.8333 \times (3.1416 \times 10 \times 2)$$

$$L = 52.4 \text{ cm} \quad \checkmark$$

Broumi, Ramayan Singh, Arindam Dey, Neutrosophic NS set hypothesis gives another way to deal with the vulnerabilities of the shortest path problems SPP Several researchers have worked on fuzzy shortest path problem FSPP in a fuzzy graph with vulnerability data and completely different applications in real world eventualities However the uncertainty related to the inconsistent information and indeterminate information isn't properly expressed by fuzzy set The neutrosophic set deals these forms of uncertainty This paper presents a model for shortest path problem with various arrangements of integer valued trapezoidal neutrosophic INVTpNS and integer valued triangular neutrosophic INVTrNS We characterized this issue as Neutrosophic Shortest way problem NSSPP The established linear programming LP model solves the classical SPP that consists of crisp parameters To the simplest of our data there is no multi objective applied mathematics approach in literature for finding the Neutrosophic shortest path problem NSSPP Chemical Change in Deforming Materials Brian Bayly, 1993-01-21 This book is the first to detail the chemical changes that occur in deforming materials subjected to unequal compressions While thermodynamics provides at the macroscopic level an excellent means of understanding and predicting the behavior of materials in equilibrium and non equilibrium states much less is understood about nonhydrostatic stress and interdiffusion at the chemical level Little is known for example about the chemistry of a state resulting from a cylinder of deforming material being more strongly compressed along its length than radially a state of non equilibrium that remains no matter how ideal the cylinder's condition in other respects M Brian Bayly here provides the outline of a comprehensive approach to gaining a simplified and unified understanding of such phenomena The author's perspective differs from those commonly found in the technical literature in that he emphasizes two little used equations that allow for a description and clarification of viscous deformation at the chemical level Written at a level that will be accessible to many non specialists this book requires only a fundamental understanding of elementary mathematics the nonhydrostatic stress state and chemical potential Geochemists petrologists structural geologists and materials scientists will find Chemical Change in Deforming Materials interesting and useful
