

DESCRIPTION AND OPERATION

Figure 2-1. Neutral Power Flow

(3) Downward movement of the first or second clutch trimmer displaces transmission fluid into the trimmer regulator circuit. The trim boost accumulator valve absorbs the displaced transmission fluid, allowing for smooth clutch application.

2-19. TORQUE PATHS THROUGH TRANSMISSION

a. Converter Operation. Power is transmitted hydraulically through the torque converter. The engine drives the converter pump. The pump throws transmission fluid against the vanes of the turbine, imparting torque to the converter turbine shaft. From the turbine, the fluid flows between the vanes of the stator, and re-enters the converter pump where the cycle begins again. The torque path through the torque converter is identical in all drive situations and in

neutral. When the engine is idling, impact of the fluid upon the turbine vanes is negligible. When the engine is accelerated, the impact is increased and the torque produced in the converter turbine shaft can exceed the engine torque (by an amount equal to the torque ratio of the converter).

b. Neutral Operation (Figure 2-1)

(1) Torque produced in the torque converter is not transmitted beyond the turbine shaft and forward clutch housing assembly. Only first clutch is applied. Because two clutches must be applied to produce output shaft rotation, no output rotation occurs.

(2) For AT 1500 Series models, the lockup clutch does not apply during neutral operation.
