Neurosciences Marc Jeannerod:

, Motor Cognition Marc Jeannerod, 2006-06-29 Our ability to acknowledge and recognize our own identity our self is a characteristic doubtless unique to humans Where does this feeling come from How does the combination of neurophysiological processes coupled with our interaction with the outside world construct this coherent identity We know that our social interactions contribute via the eyes ears etc However our self is not only influenced by our senses It is also influenced by the actions we perform and those we see others perform Our brain anticipates the effects of our own actions and simulates the actions of others In this way we become able to understand ourselves and to understand the actions and emotions of others This book describes the new field of Motor Cognition Though motor actions have long been studied by neuroscientists and physiologists it is only recently that scientists have considered the role of actions in building the self How consciousness of action is part of self consciousness how one's own actions determine the sense of being an agent how actions performed by others impact on ourselves for understanding others differentiating ourselves from them and learning from them these questions are raised and discussed throughout the book drawing on experimental clinical and theoretical bases The advent of new neuroscience techniques such as neuroimaging and direct electrical brain stimulation together with a renewal of behavioral methods in cognitive psychology provide new insights into this area Mental imagery of action self recognition consciousness of actions imitation can be objectively studied using these new tools The results of these investigations shed light on clinical disorders in neurology psychiatry and in neuro development *The Cognitive Neuroscience of Action* Marc Jeannerod, 1997-03-06 This book is one of the first in an exciting new series of tutorials in cognitive neuroscience and provides a concise readable and up to date review of cognitive and neuroscience studies of the representations for actions The fundamental question addressed concerns the nature and role of different representations in the planning and execution of movements *The Amygdaloid Nuclear Complex* Vincent Di Marino, Yves Etienne, Maurice Niddam, 2015-12-31 This timely book allows clinicians of the nervous system who are increasingly confronted with degenerative and psychiatric diseases to familiarize themselves with the cerebral amygdala and the anatomical structures involved in these pathologies Its striking photos of cerebral sections and dissections should help MRI specialists to more precisely study the detailed images provided by their constantly evolving equipment **The Self in Neuroscience and Psychiatry** Tilo Kircher, Anthony S. David, 2003-08-07 In recent years the clinical and cognitive sciences and neuroscience have contributed important insights to understanding the self The neuroscientific study of the self and self consciousness is in its infancy in terms of established models available data and even vocabulary However there are neuropsychiatric conditions such as schizophrenia in which the self becomes disordered and this aspect can be studied against healthy controls through experiment building cognitive models of how the mind works and imaging brain states In this 2003 book the first to address the scientific contribution to an understanding of the self an eminent international team focuses on current

models of self consciousness from the neurosciences and psychiatry These are set against introductory essays describing the philosophical historical and psychological approaches making this a uniquely inclusive overview It will appeal to a wide audience of scientists clinicians and scholars concerned with the phenomenology and psychopathology of the self

Computational Neuroscience Eric L. Schwartz, 1993-08-26 The thirty original contributions in this book provide a working definition of computational neuroscience as the area in which problems lie simultaneously within computer science and neuroscience They review this emerging field in historical and philosophical overviews and in stimulating summaries of recent results Leading researchers address the structure of the brain and the computational problems associated with describing and understanding this structure at the synaptic neural map and system levels The overview chapters discuss the early days of the field provide a philosophical analysis of the problems associated with confusion between brain metaphor and brain theory and take up the scope and structure of computational neuroscience Synaptic level structure is addressed in chapters that relate the properties of dendritic branches spines and synapses to the biophysics of computation and provide a connection between real neuron architectures and neural network simulations The network level chapters take up the preattentive perception of 3 D forms oscillation in neural networks the neurobiological significance of new learning models and the analysis of neural assemblies and local learning rules Map level structure is explored in chapters on the bat echolocation system cat orientation maps primate stereo vision cortical cognitive maps dynamic remapping in primate visual cortex and computer aided reconstruction of topographic and columnar maps in primates The system level chapters focus on the oculomotor system VLSI models of early vision schemas for high level vision goal directed movements modular learning effects of applied electric current fields on cortical neural activity neuropsychological studies of brain and mind and an information theoretic view of analog representation in striate cortex Eric L. Schwartz is Professor of Brain Research and Research Professor of Computer Science Courant Institute of Mathematical Sciences New York University Medical Center Computational Neuroscience is included in the System Development Foundation Benchmark Series

The Emergence of Neuroscience and the German Novel Sonja Boos, 2021-09-29 The Emergence of Neuroscience and the German Novel Poetics of the Brain revises the dominant narrative about the distinctive psychological inwardness and introspective depth of the German novel by reinterpreting the novel's development from the perspective of the nascent discipline of neuroscience the emergence of which is coterminous with the rise of the novel form In particular it asks how the novel's formal properties stylistic narrative rhetorical and figurative correlate with the formation of a neuroscientific discourse and how the former may have assisted disrupted and or intensified the medical articulation of neurological concepts This study poses the question how does this rapidly evolving field emerge in the context of nineteenth century cultural practices and what were the conditions for its emergence in the German speaking world specifically Where did neuroscience begin and how did it broaden in scope And most crucially to what degree does it owe its existence to literature

Neuroscience Jean-Claude Dreher, Léon Tremblay, 2016-09-27 Decision Neuroscience addresses fundamental questions about how the brain makes perceptual value based and more complex decisions in non social and social contexts This book presents compelling neuroimaging electrophysiological lesional and neurocomputational models in combination with hormonal and genetic approaches which have led to a clearer understanding of the neural mechanisms behind how the brain makes decisions The five parts of the book address distinct but inter related topics and are designed to serve both as classroom introductions to major subareas in decision neuroscience and as advanced syntheses of all that has been accomplished in the last decade Part I is devoted to anatomical neurophysiological pharmacological and optogenetics animal studies on reinforcement guided decision making such as the representation of instructions expectations and outcomes the updating of action values and the evaluation process guiding choices between prospective rewards Part II covers the topic of the neural representations of motivation perceptual decision making and value based decision making in humans combining neurocomputational models and brain imaging studies Part III focuses on the rapidly developing field of social decision neuroscience integrating recent mechanistic understanding of social decisions in both non human primates and humans Part IV covers clinical aspects involving disorders of decision making that link together basic research areas including systems cognitive and clinical neuroscience this part examines dysfunctions of decision making in neurological and psychiatric disorders such as Parkinson s disease schizophrenia behavioral addictions and focal brain lesions Part V focuses on the roles of various hormones cortisol oxytocin ghrelin leptine and genes that underlie inter individual differences observed with stress food choices and social decision making processes The volume is essential reading for anyone interested in decision making neuroscience With contributions that are forward looking assessments of the current and future issues faced by researchers Decision Neuroscience is essential reading for anyone interested in decision making neuroscience Provides comprehensive coverage of approaches to studying individual and social decision neuroscience including primate neurophysiology brain imaging in healthy humans and in various disorders and genetic and hormonal influences on decision making Covers multiple levels of analysis from molecular mechanisms to neural systems dynamics and computational models of how we make choices Discusses clinical implications of process dysfunctions including schizophrenia Parkinson s disease eating disorders drug addiction and pathological gambling Features chapters from top international researchers in the field and full color presentation throughout with numerous illustrations to highlight key concepts [Intersubjectivity in Psychoanalysis](#) Lewis Kirshner, 2017-05-12 In this book Lewis Kirshner explains and illustrates the concept of intersubjectivity and its application to psychoanalysis By drawing on findings from neuroscience infant research cognitive psychology Lacanian theory and philosophy Kirshner argues that the analytic relationship is best understood as a dialogic exchange of signs between two

subjects a semiotic process Both subjects bring to the interaction a history and a set of unconscious desires which inflect their responses In order to work most effectively with patients analysts must attend closely to the actual content of the exchange rather than focusing on imagined contents of the patient's mind The current situation revives a history that is shaped by the analyst's participation Supported by numerous case studies Intersubjectivity in Psychoanalysis A Model for Theory and Practice is a valuable resource for psychotherapists and analysts seeking to refine their clinical goals and methods
