Forward Position

When the fluid selector is shifted slightly forward, the pump selector valve is closed at a slight angle and a small quantity of fluid is discharged from the pump selector into passage "1". This small quantity of fluid passes through the selector valve, "1" and returns to the return valve causing a slight pressure increase in passage "1". When the fluid selector is depressed further forward, increased fluid flows from the pump selector through passage "1". Pump pressure on the back of fluid selector valve, "2" causes the fluid valve and pistons to move to the return valve, "3". At a pressure above 14.1 - 17.2 (psi) (100 - 140 psi), the return valve, "3" causes the return to return and fluid flow back pump selector "4". Flow to the hydraulic motor.

Reverse Position

When the fluid selector is depressed in the reverse position, fluid flow back to the hydraulic pump, "1" into passage "1". Pump pressure on the back of fluid selector valve, "2" causes it to close and increase pressure on the return valve, "3". At a pressure above 14.1 - 17.2 (psi) (100 - 140 psi), the return valve, "3" causes the return to return and fluid flow back pump selector "4". Flow to the hydraulic motor.

Fluid pressure acting on the return pistons causes the return to close in the reverse direction. Fluid discharged from the motor, "8", flow back through

passage "1" to the hydraulic pump, "1" to complete the cycle. When fluid discharge in the system causes a slight pressure on the return passage "1" below 14.1 - 14.5 psi (10 - 100 psi) pressure acting, fluid selector valve, "2" opens and provides return to fluid flow the charge pump. From fluid flow the charge pump is returned to the pump via the charge pump relief valve, "9".

The high pressure relief valve, "9" protects the motor by limiting what pressure is above 17.0 to 17.5 psi (100 - 140 psi).
