Discontinuity location and size (plan view). - Answer✓✓-When a C-scan is used to produce a permanent record of an ultrasonic test, the information displayed is typically the:

Loss of echo amplitude from discontinuities and an increase in the width of the front surface echo. -

Answer✓✓-Rough entry surface echo conditions can result in:

The attenuation - Answer✓✓-As the grain size increases in a material, its principal effect in ultrasonic testing is on:

Decrease it - Answer✓✓-In straight beam pulse echo testing a discontinuity with a rough reflecting surface perpendicular to the incident wave will have what effect on the detected signal in comparison to a smooth flat-bottom hole of the same size? (Increase, decrease, no effect, decrease the width of the pulse of it.)

Machine Oil - Answer✓✓-Ultrasonic vibrations can be propagated only in the longitudinal mode in which of the following media? (Machine oil, Aluminum, Ice, Beryllium)

The same as the velocity at 1/2 inch - Answer✓✓-If the velocity of a longitudinal mode wave in a given homogeneous material is .625 cm/micro second at 1/2 inch below the surface, what is the velocity at 2 inches below the surface? (1/4 the velocity at 1/2 inch, 1/2 the velocity at 1/2 inch, the same, none of the above)

Introduction to Nondestructive Testing Paul E. Mix, 2005-06-10 This updated Second Edition covers current state of the art technology and instrumentation The Second Edition of this well respected publication provides updated coverage of basic nondestructive testing NDT principles for currently recognized NDT methods The book provides information to help students and NDT personnel qualify for Levels I II and III certification in the NDT methods of their choice It is organized in accordance with the American Society for Nondestructive Testing ASNT Recommended Practice No SNT TC 1A 2001 Edition Following the author s logical organization and clear presentation readers learn both the basic principles and applications for the latest techniques as they apply to a wide range of disciplines that employ NDT including space shuttle engineering digital technology and process control systems All chapters have been updated and expanded to reflect the development of more advanced NDT instruments and systems with improved monitors sensors and software analysis for instant viewing and real time imaging Keeping pace with the latest developments and innovations in the field five new chapters have been added Vibration Analysis Laser Testing Methods Thermal Infrared Testing Holography and Shearography Overview of Recommended Practice No SNT TC 1A 2001 Each chapter covers recommended practice topics such as basic principles or theory of operation method advantages and disadvantages instrument description and use brief operating and calibrating procedures and typical examples of flaw detection and interpretation where applicable

Introduction to Piping Quality Control Ram Babu Sao, 2025-03-23 The terms Quality Control and Quality Assurance are often used interchangeably but they are not synonymous Quality Assurance is a program executed by company management Quality Control is a task that takes place on the production floor Two aspects are quality control QC and quality assurance QA Understanding these programs and their roles is critical in making sure the respective engineer to carry out their duties effectively There are three most important criteria for evaluating the Quality Control of work such as Cost Time of delivery and Quality Quality is most important factor out of the three Quality isn t simply a cost It is a powerful tool that contributes to the economic success of the work Therefore there is need to control all three but quality is the most significant Many manufacturers recognize that quality leads to a higher customer retention rate and helps to build competitive boundaries However the term quality by itself isn t sufficient ISO 9000 definitions the QC is the operational techniques and activities that are utilized to fulfil requirements for quality and QA is all those planned and systematic activities implemented to provide adequate confidence that the entity will fulfil requirements for quality QC is a production line function The aim of QC is to offer the highest reasonable quality of product or service to the client thereby meeting or even exceeding the client s requirements The QA manager is interested in investigating technologies and processes that prevent defects QA is a staff function The aim of QA is to apply a planned and systematic production process establishing confidence that the process generates suitable products QC method is intended to provide regular product inspection thereby guaranteeing the output s correctness completeness

and integrity It finds and addresses mistakes They file and record all the QC procedures The product or service needs to be suitable and fit for the intended purpose The methods and processes should decrease errors and shortcomings the first time through the manufacturing process QC is product oriented it focuses on tests and inspections carried out at various production line checkpoints QA is process oriented its concerns are process definitions proper selection of tools proper use of testing methods and operator training QC works at locating defects QA works at preventing them QC emphasizes testing of products to discover defects and reporting the results to management QA attempts to improve and stabilize production to minimize or prevent the conditions that trigger defects Typically quality control involves problem identification problem analysis problem correction and feedback Quality assurance involves data collection problem trend analysis process identification process analysis and process improvement
