Co-use of medicines in surgery is important for a successful operation. There are several kinds of drugs used for preoperative, intraoperative and postoperative treatment. For instance, the co-use of sterilization, anti-inflammation and hemostasis drugs is necessary for most surgical operations. Moreover, the sedative drugs used preoperatively can alleviate patients' concerns. The anti-allergic drugs, i.e. hormone drugs, can prevent allergies caused by some medications used during surgery. The drugs inhibiting glandular secretion can reduce the secretion of sputum which

keeps patients respiratory tract unobstructed and reduces the risk of aspiration Before and after surgery the use of anti cancer visceral and many other medicines play a key role in disease treatment Current disease treatment is based on medicine and surgery In many hospitals however the drug department is not directly involved in surgical operation Although the doctors have sufficient knowledge in medicines it is suggested to pay more attention to the interaction and balance between medicine and surgery With the development of new drugs there are growing needs of co use of medicines for preoperative intraoperative and postoperative treatment Therefore this Research Topic would attract surgical studies with specificities in using medicines and advanced healthcare techniques monitoring biochemical indicators and concentrations relative to pharmacokinetics understanding and balancing the interaction between medicine and surgery The outcome of the Research Topic may contribute to the improvement of surgical protocols from a pharmaceutical perspective The aim of the current Research Topic is to cover promising recent and novel research trends in co use of medicines in surgery Areas to be covered in this Research Topic may include but are not limited to Model informed medicine and surgery Medicines for preoperative intraoperative and postoperative treatment Advanced healthcare techniques Pharmacokinetics biochemical indicators and concentrations Balance of medicine and surgery from perspective of pharmacists and nurses Improved surgical protocols Sterilization anti inflammation and hemostasis drugs Sedative and anti allergic and secretion inhibiting drugs Visceral drugs for disease treatment Clinical practice and case report

**Chip Multiprocessor Architecture** Kunle Olukotun, Lance Hammond, James Laudon, 2022-05-31 Chip multiprocessors also called multi core microprocessors or CMPs for short are now the only way to build high performance microprocessors for a variety of reasons Large uniprocessors are no longer scaling in performance because it is only possible to extract a limited amount of parallelism from a typical instruction stream using conventional superscalar instruction issue techniques In addition one cannot simply ratchet up the clock speed on today's processors or the power dissipation will become prohibitive in all but water cooled systems Compounding these problems is the simple fact that with the immense numbers of transistors available on today's microprocessor chips it is too costly to design and debug ever larger processors every year or two CMPs avoid these problems by filling up a processor die with multiple relatively simpler processor cores instead of just one huge core The exact size of a CMP's cores can vary from very

simple pipelines to moderately complex superscalar processors but once a core has been selected the CMP's performance can easily scale across silicon process generations simply by stamping down more copies of the hard to design high speed processor core in each successive chip generation. In addition, parallel code execution obtained by spreading multiple threads of execution across the various cores can achieve significantly higher performance than would be possible using only a single core. While parallel threads are already common in many useful workloads, there are still important workloads that are hard to divide into parallel threads. The low inter-processor communication latency between the cores in a CMP helps make a much wider range of applications viable candidates for parallel execution than was possible with conventional multi-chip multiprocessors. Nevertheless, limited parallelism in key applications is the main factor limiting acceptance of CMPs in some types of systems. After a discussion of the basic pros and cons of CMPs when they are compared with conventional uniprocessors, this book examines how CMPs can best be designed to handle two radically different kinds of workloads that are likely to be used with a CMP: highly parallel, throughput sensitive applications at one end of the spectrum and less parallel, latency sensitive applications at the other. Throughput sensitive applications such as server workloads that handle many independent transactions at once require careful balancing of all parts of a CMP that can limit throughput such as the individual cores, on-chip cache memory, and off-chip memory interfaces. Several studies and example systems such as the Sun Niagara that examine the necessary tradeoffs are presented here. In contrast, latency sensitive applications, many desktop applications fall into this category, require a focus on reducing inter-core communication latency and applying techniques to help programmers divide their programs into multiple threads as easily as possible. This book discusses many techniques that can be used in CMPs to simplify parallel programming with an emphasis on research directions proposed at Stanford University. To illustrate the advantages possible with a CMP using a couple of solid examples, extra focus is given to thread level speculation (TLS), a way to automatically break up nominally sequential applications into parallel threads on a CMP, and transactional memory. This model can greatly simplify manual parallel programming by using hardware instead of conventional software locks to enforce atomic code execution of blocks of instructions, a technique that makes parallel coding much less error prone.

Contents: The Case for CMPs, Improving Throughput, Improving Latency, Automatically Improving Latency using Manual Parallel Programming, A Multicore World, The Future of CMPs.
