

is adjustable, it is used to change the operating range of the refrigeration system and the temperature of the evaporator. Thus, the thermal switch determines the temperature of the air delivered to the car interior when cooling is called for. On these past models, a blend-air door is used to control temperature for heater and defroster operation only. In other words, the heating and cooling functions are not completely integrated.

Fig. 4—Past-model adjustable thermal switch

The thermal switches used on past model compacts are calibrated to control minimum opera-

ting temperature. As a result, the thermal switch prevents evaporator frosting as well as adjusting the temperature operating range of the refrigeration system.

THE NON-ADJUSTABLE ANTIFREEZE SWITCH

On the 1973 compacts, the adjustable thermal switch has been replaced by a non-adjustable antifreeze switch. It opens the clutch circuit before the evaporator gets cold enough to cause frosting. The antifreeze switch opens the clutch circuit at about 33 degrees. It closes and engages the compressor clutch circuit again as soon as the evaporator temperature reaches about 38 degrees.

ANTIFREEZE SWITCH AND CLUTCH CIRCUIT TEST

You can use the suction gauge to check the operation of the antifreeze switch and the cycling of the compressor clutch. To establish conditions which will insure cycling of the clutch, the system should be operated on MAX A/C. Close all windows and doors and run the blower at low speed. This will put a minimum heat load on the evaporator so that it will get cold enough to open the antifreeze switch and disengage the compressor clutch.

The clutch should disengage when the suction pressure drops to approximately 12 to 20 p.s.i. The clutch should engage again as soon as the suction pressure increases to approximately 35 p.s.i.

MTSC 73

BASIC AIR FLOW CONTROL

Although the refrigeration changes in the 1973 air-conditioning system for compacts are minor, the air flow and temperature controls are entirely new. Figure 5 provides an overall orientation to the system components. For all operating conditions, except MAX A/C, outside air is drawn in through the grille and plenum chamber. These are an integral part of the body structure. Notice that the blower is now located between the evaporator and the heater core and all air must pass through the evaporator.

CONTROL STARTS AT THE INLET AIR DOOR

Air flow control starts at the inlet air door. In Figure 5 the inlet air door is positioned so that only outside air enters the system. For all operating modes, except MAX A/C, the system operates on outside air.

Figure 6 illustrates air flow for MAX A/C. The inlet air door is closing off outside air and has opened to inside or recirculated air. This door also closes off outside air flow when the selector lever is moved to the OFF position.
