Chemical Safety of Drinking-water Terrence Thompson, World Health Organization, 2007 Contamination of drinking water is a significant concern for public health throughout the world Microbial hazards make the largest contribution to waterborne disease in developed and developing countries Nevertheless chemicals in water supplies can cause serious health problems whether the chemicals are naturally occurring or derive from sources of

pollution At a global scale fluoride and arsenic are the most significant chemicals each affecting perhaps millions of people However many other chemicals can be important contaminants of drinking water under specific local conditions Often identification and assessment of risks to health from drinking water relies excessively on analysis of water samples The limitations of this approach are well recognized and contributed to the delay in recognizing arsenic in drinking water as a significant health concern in Bangladesh and elsewhere To overcome such limitations the latest edition of the World Health Organization WHO Guidelines for Drinking water Quality WHO 2004 WHO 2006 emphasizes effective preventive management through a framework for drinking water safety that incorporates water safety plans Effective preventive management of chemicals in drinking water requires simple tools for distinguishing the few chemicals of potential local or national concern from the unmanageably long list of chemicals of possible significance The aim is to identify and prioritize the chemicals of concern to overcome the limitations of direct analysis of water quality and ensure that limited resources are allocated towards the monitoring assessment and control of the chemicals that pose the greatest health risks Identifying and prioritizing chemical risks presents a challenge especially in developing countries because information on the presence of chemicals in water supplies is often lacking This document provides guidance to help readers to meet that challenge It shows how information on aspects such as geology and industrial and agricultural development which is often readily available can be used to identify potential chemical contaminants and potential sources of chemicals from catchment to consumer and thus prioritize risks As a supporting document to the Guidelines for Drinking water Quality WHO 2004 WHO 2006 this publication is aimed at policy makers regulators managers and public health practitioners at national and local level It is divided into three parts Part A provides general guidance on using limited information in prioritizing chemicals in drinking water for risk management The need for such guidance is outlined in Chapter 1 which also describes the administrative and policy context Chapter 2 describes the principles applied in prioritizing chemicals provides information on some factors that affect chemical concentrations along pathways and highlights several specific chemicals that are frequently considered priorities because of their widespread occurrence or significant health effects Chapter 3 discusses the role of drinking water standards and guidelines and provides an overview of contemporary water quality management procedures Part B provides practical guidance on identifying specific chemicals that are likely to be of concern in individual water supply systems It groups chemical contaminants into five categories on the basis of their potential sources naturally occurring from agriculture activities from human settlements from industrial activities and from water treatment and distribution processes themselves Part C comprises the appendices It includes guidance on the most likely sources of potential contaminants and on identifying chemicals that could be of concern in particular circumstances The appendices address potential sources of chemicals considered in the WHO drinking water guidelines WHO 2004 WHO 2006 chemicals potentially discharged in effluents from industrial sources and the association of pesticides with crops and crop types This information is presented in an accessible

format that will help users to determine the chemical hazards that can arise in the catchment in treatment and in distribution in large medium and small water supplies Many experts worldwide contributed to this work over a period of several years beginning with the 1st Meeting of Experts on Monitoring Chemicals in Drinking Water held in Bangkok Thailand in January 2001 This was followed by the 2nd Meeting of Experts on Monitoring Chemicals in Drinking Water also held in Bangkok in December 2001 Both meetings were sponsored by WHO and hosted by the Department of Health Ministry of Public Health Thailand The draft guidance document was subsequently tested in a series of field trials in 2002 2003 in Indonesia Fiji Nepal Mongolia the Philippines and Thailand Lessons learnt through the field trials provided feedback that was valuable in revising and finalizing the document Readers should note that while this publication has been developed as a supporting document for and with reference to the Guidelines for Drinking water Quality the guidelines themselves are frequently updated and the latest information should always be sought by reference to relevant World Health Organization publications and web site http://www.who.int/water_sanitation_health/dwq/guidelines/en/index.html

Toxicological Risk Assessment of Chemicals Elsa Nielsen, Grete Ostergaard, John Christian Larsen, 2008-02-21 Unlike many existing books on toxicology that cover either toxicity of a particular substance or toxicity of chemicals on particular organ systems *Toxicological Risk Assessment of Chemicals A Practical Guide* lays out the principle activities of conducting a toxicological risk assessment including international approaches and methods for the risk
