Probability And Social Science Methodological Relationships Between The Two Approaches Methodos Series:

Probability and Social Science Daniel Courgeau, 2012-02-23 This work examines in depth the methodological relationships that probability and statistics have maintained with the social sciences from their emergence. It covers both the history of thought and current methods. First it examines in detail the history of the different paradigms and axioms for probability from their emergence in the seventeenth century up to the most recent developments of the three major concepts: objective, subjective and logicist probability. It shows the statistical inference they permit, different applications to social sciences and the main problems they encounter. On the other side, from social sciences, particularly population sciences, to probability, it shows the different uses they made of probabilistic concepts during their history from the seventeenth century according to their paradigms: cross sectional, longitudinal, hierarchical, contextual and multilevel approaches. While the ties may have seemed loose at times, they have more often been very close. Some advances in probability were driven by the search for answers to questions raised by the social sciences; conversely, the latter have made progress thanks to advances in probability. This dual approach sheds new light on the historical development of the social sciences and probability and on the enduring relevance of their links. It permits also to solve a number of methodological problems encountered all along their history.

Sequence Analysis and Related Approaches Gilbert Ritschard, Matthias Studer, 2018-10-17 This open access book provides innovative methods and original applications of sequence analysis (SA) and related methods for analysing longitudinal data describing life trajectories such as professional careers, family paths, the succession of health statuses or the time use. The applications as well as the methodological contributions proposed in this book pay special attention to the combined use of SA and other methods for longitudinal data such as event history analysis, Markov modelling and sequence network. The methodological contributions in this book include among others original propositions for measuring the precarity of work trajectories, Markov based methods for clustering sequences, fuzzy and monothetic clustering of sequences, network based SA, joint use of SA and hidden Markov models and of SA and survival models. The applications cover the comparison of gendered occupational trajectories in Germany, the study of the changes in women market participation in Denmark, the study of typical day of dual earner couples in Italy, of mobility patterns in Togo, of internet addiction in Switzerland and of the quality of employment career after a first unemployment spell. As such, this book provides a wealth of information for social scientists interested in quantitative life course analysis and all those working in sociology, demography, economics, health psychology, social policy and statistics.

Agent-Based Modelling in Population Studies André Grow, Jan Van Bavel, 2016-08-11 This book examines the use of agent based modelling (ABM) in population studies from concepts to applications, best practices to future developments. It features papers written by leading experts in the field that will help readers to better understand the usefulness of ABM for population projections, how ABM can be injected with empirical data to achieve a better match between model and reality, how geographic information can be fruitfully used in ABM and how ABM

results can be reported effectively and correctly Coverage ranges from detailing the relation between ABM and existing paradigms in population studies to infusing agent based models with empirical data The papers show the benefits that ABM offers the field including enhanced theory formation by better linking the micro level with the macro level the ability to represent populations more adequately as complex systems and the possibility to study rare events and the implications of alternative mechanisms in artificial laboratories In addition readers will discover guidelines and best practices with detailed examples of how to apply agent based models in different areas of population research including human mating behaviour migration and socio structural determinants of health behaviours Earlier versions of the papers in this book have been presented at the workshop Recent Developments and Future Directions in Agent Based Modelling in Population Studies which took place at the University of Leuven KU Leuven Belgium in September 2014 The book will contribute to the development of best practices in the field and will provide a solid point of reference for scholars who want to start using agent based modelling in their own research
