Teaching Statistics Using Baseball Jim Albert, 2022-02-04 Teaching Statistics Using Baseball is a collection of case studies and exercises applying statistical and probabilistic thinking to the game of baseball. Baseball is the most statistical of all sports since players are identified and evaluated by their corresponding hitting and pitching statistics. There is an active effort by people in the baseball community to learn more about baseball performance and strategy by the use of statistics. This book illustrates basic methods of data analysis and probability models by means of baseball statistics collected on players and teams. Students often have difficulty learning statistics ideas since they are explained using examples that are foreign to the students. The idea of the book is to describe statistical thinking in a context that is baseball that will be familiar and interesting to students. The book is organized using a same structure as most introductory statistics texts. There are chapters on the analysis on a single batch of data followed with chapters on comparing batches of data and relationships. There are chapters on probability models and on statistical inference. The book can be used as the framework for a one semester introductory statistics class focused on baseball or sports. This type of class has been taught at Bowling Green State University. It may be very suitable for a statistics class for students with sports related majors such as sports management or sports medicine. Alternately the book can be used as a resource for instructors who wish to infuse their present course in probability or statistics with applications from baseball. The second edition of Teaching Statistics follows the same structure as the first edition where the case studies and exercises have been replaced by modern players and teams and the new types of baseball data from the PitchFX system and fangraphs.com are incorporated into the text. **Probability and Bayesian**

Modeling Jim Albert, Jingchen Hu, 2019-12-06 Probability and Bayesian Modeling is an introduction to probability and Bayesian thinking for undergraduate students with a calculus background. The first part of the book provides a broad view of probability including foundations, conditional probability, discrete and continuous distributions, and joint distributions. Statistical inference is presented completely from a Bayesian perspective. The text introduces inference and prediction for a single proportion and a single mean from Normal sampling. After fundamentals of Markov Chain Monte Carlo algorithms are introduced, Bayesian inference is described for hierarchical and regression models including logistic regression. The book presents several case studies motivated by some historical Bayesian studies and the authors' research. This text reflects modern Bayesian statistical practice. Simulation is introduced in all the probability chapters and extensively used in the Bayesian material to simulate from the posterior and predictive distributions. One chapter describes the basic tenets of Metropolis and Gibbs sampling algorithms; however, several chapters introduce the fundamentals of Bayesian inference for conjugate priors to deepen understanding. Strategies for constructing prior distributions are described in situations when one has substantial prior information and for cases where one has weak prior knowledge. One chapter introduces hierarchical Bayesian modeling as a practical way of combining data from different groups. There is an extensive discussion of Bayesian

regression models including the construction of informative priors inference about functions of the parameters of interest prediction and model selection The text uses JAGS Just Another Gibbs Sampler as a general purpose computational method for simulating from posterior distributions for a variety of Bayesian models An R package ProbBayes is available containing all of the book datasets and special functions for illustrating concepts from the book A complete solutions manual is available for instructors who adopt the book in the Additional Resources section Lattice Statistics and Mathematical Physics

SPIN Model Checking and Software Verification

Klaus Havelund, John Penix, Willem Visser, 2006-12-31 The SPIN workshop is a forum for researchers interested in the subject of automata based explicit state model checking technologies for the analysis and verification of asynchronous concurrent and distributed systems The SPIN model checker <http://netlib.bell-labs.com/netlib/spin/whatispin.html> developed by Gerard Holzmann is one of the best known systems of this kind and has attracted a large user community This can likely be attributed to its efficient state exploration algorithms The fact that SPIN's modeling language Promela resembles a programming language has probably also contributed to its success Traditionally the SPIN workshops present papers on extensions and uses of SPIN As an experiment this year's workshop was broadened to have a slightly wider focus than previous workshops in that papers on software verification were encouraged Consequently a small collection of papers describe attempts to analyze and verify programs written in conventional programming languages Solutions include translations from source code to Promela as well as specially designed model checkers that accept source code We believe that this is an interesting research direction for the formal methods community and that it will result in a new set of challenges and solutions Of course abstraction becomes the key solution to deal with very large state spaces However we also see potential for integrating model checking with techniques such as static program analysis and testing Papers on these issues have therefore been included in the proceedings

Computational statistical physics Sitangshu Bikas Santra, Purusattam Ray, 2011-07-15 The present book is an outcome of the SERC school on Computational Statistical Physics held at the Indian Institute of Technology Guwahati in December 2008 Numerical experimentation has played an extremely important role in statistical physics in recent years Lectures given at the School covered a large number of topics of current and continuing interest Based on lectures by active researchers in the field Bikas Chakrabarti S Chakraborty Deepak Dhar Sanjay Kumar Prabal Maiti Sanjay Puri Purusattam Ray Sitangshu Santra and Subir Sarkar the nine chapters comprising the book deal with topics that range from the fundamentals of the field to problems and questions that are at the very forefront of current research This book aims to expose the graduate student to the basic as well as advanced techniques in computational statistical physics Following a general introduction to statistical mechanics and critical phenomena the various chapters cover Monte Carlo and molecular dynamics simulation methodology along with a variety of applications These include the study of coarsening phenomena and diffusion in zeolites p In addition

graphical enumeration techniques are covered in detail with applications to percolation and polymer physics and methods for optimisation are also discussed Beginning graduate students and young researchers in the area of statistical physics will find the book useful In addition this will also be a valuable general reference for students and researchers in other areas of science and engineering
