

INTRODUCTION

This guide is designed to teach and inform about wounds and their care. The first section covers the anatomy of the skin and describes general facts about wounds. Chronic wounds and their treatment are described on the inside pages, including diabetic foot ulcers. Various leg wounds and wound care products are detailed on the back page. Your healthcare provider is the best source of information about taking care of your skin. Always check with your healthcare provider if your wound is deep, you don't know how you got it, you think it may be infected, or it isn't healing as expected.

THE SKIN

Structure of the Skin

The skin is the largest body organ. It starts in the brain from very thin tissue and the epidermis is quite thick (as on the sole of the foot). The epidermis, or outer layer of the skin, sheds layers and replaces itself every 4-6 weeks. The dermis is the layer under the epidermis containing blood vessels and nerves which provide strength and support to the skin. Below the dermis lies subcutaneous tissue, providing a cushion and structural support for the skin. All layers of tissue below the epidermis are moist, this is why wounds heal faster in the lower body where slightly moist than when kept dry.

Function of the Skin

The skin provides protection from ultraviolet radiation, infections and other harmful things. Nerve endings in the skin allow us to feel pain, heat, pressure, heat and cold. The skin helps control our body temperature and helps produce vitamin D when exposed to sunlight.

The body is constantly exposed to factors that can damage the skin. Ultraviolet radiation from sunlight or tanning beds, irritating chemicals on the skin, or in the home, even the drying effects of home heating systems and use of alkaline soaps can contribute to skin problems. Adequate nutrition and fluid intake are needed for healthy skin. Good skin care, use of moisturizer on dry areas, and consistent use of sunscreen lotion can help your skin stay healthy.

THE BASICS

What is a Wound?

A wound is a break in the skin caused by disease, trauma, burns or other injuries. Some common minor wounds are scrapes, small cuts and blisters that heal shortly. Usually the body heals quickly after a minor wound, sometimes without needing medical care. An acute wound is one that happens suddenly. The cause of the wound is known, and it leads to an early heal. A chronic wound is one that persists for a number of months or comes back again after healing initially. Many diseases can cause a chronic wound or affect your body's ability to heal.

Wound Damage Severity

Sometimes healthcare providers describe the depth of the injury in three terms:

- **Partial Thickness:** The wound extends through the epidermis and into the dermis.
- **Full Thickness:** The wound extends through the dermis past epidermis and may affect underlying structures such as subcutaneous tissue, muscle, and bone.

How Do Wounds Heal?

After an injury, a complex series of events starts the process of tissue repair. Cells in the skin and blood vessels work to stop bleeding, close up the wound and begin to close it. Some of the cells important to this process are white blood cells, fibroblasts, fibroblasts, and epithelial cells. The wound can begin to cover with new skin within just a day or two, while deep wounds must first fill with new connective tissue, which looks dark red and rough. New blood vessels are formed and the edges of the wound begin to pull together in a process called contraction. The wound eventually covers with new skin and cells from the outer edges toward the center. 1 year after a deep wound has healed, the scar continues to change as the body remodels the new tissue.

Home Care for Minor Wounds

- Apply pressure and elevate the area to stop any bleeding.
- Wash cut skin and debris with clean running water.
- Apply a bandage to cover and protect the area.
- Change the bandage when it becomes torn, the skin or the absorbent pad is filled with drainage.
- Seek medical care if the wound is deep or may need stitches.
