Principles And Practice Of Isokinetics In Sports Medicine And Rehabilitation:

Principles and Practice of Isokinetics in Sports Medicine and Rehabilitation Kai-Ming Chan, Nicola Maffulli, Pirkko Korkia, Raymond C. T. Li, 1996 Principles and Practice of Isokinetics in Sports Medicine provides a comprehensive critical review of isokinetic technology applied to sports training program testing and rehabilitation following injury and surgery. Featuring the work of renowned international contributors the reference presents a step by step guide on practical isokinetic procedures and examines the significance and validity of variables commonly measured. The scientific value of isokinetics is highlighted both for sports medicine and sport sciences enabling sports medicine practitioners to identify the merits of isokinetics and its relevant applications. The use of isokinetics in injury diagnosis and rehabilitation is outlined with specific illustrations from research data collected at the Chinese University of Hong Kong. Special attention is given to assessment of the most commonly injured sites the knee ankle shoulder and trunk. The reference offers guidelines for the interpretation of test results along with examples of how to apply the guidelines in designing appropriate rehabilitation programs. A special section is devoted to the use of isokinetics in the assessment of sport performance. Extensive photographs charts and illustrations throughout the reference highlight key points. *Rehabilitation of Sports Injuries* G. Puddu, A. Giombini, A. Selvanetti, 2013-03-09 Over the last few years in the field of sports science and medicine empirical theories about the treatment and rehabilitation of injured athletes have been gradually supported by a rapid growth of research data and scientific literature. This has permitted a better knowledge of the healing process from injury and or surgery and a more appropriate understanding of the biomechanical behavior of several biological structures to load and exercise. We agree with the opinion that development and advancement through a rehabilitation program should be based on the type and severity of the lesion healing time of the injured structures individual pain tolerance level possible adopted surgical procedure and sport specific biomechanical demands. Currently the most recent theories on rehabilitation of the injured athlete emphasize the concepts of a multidisciplinary approach a functional recovery instead of symptomatic improvement and an early mobilization with the implementation of an individualized program treating the entire body kinetic chains. Among different methods of rehabilitation the physician should choose those revealing their clinical appropriateness founded on a validated scientific data and or proven clinical efficacy. Our goal has been to provide a comprehensive coverage of principles and practical applications of the rehabilitation methods of the most common sports injuries and we have tried to combine the variety of expertise and backgrounds of a multidisciplinary group of contributing authors. *Biomechanical Evaluation of Movement in Sport and Exercise* Carl J. Payton, Adrian Burden, 2017-12-14 Now in a fully updated and revised new edition this is still the only up to date practical guide to the use of technology in sport and exercise biomechanics.
