Iterative Learning Control Hyo-Sung Ahn, Kevin L. Moore, YangQuan Chen, 2007-06-28 This monograph studies the design of robust monotonically convergent iterative learning controllers for discrete time systems. Iterative learning control (ILC) is well recognized as an efficient method that offers significant performance improvement for systems that operate in an iterative or repetitive fashion e.g. robot arms in manufacturing or batch processes in an industrial setting. Though the fundamentals of ILC design have been well addressed in the literature, two key problems have been the subject of continuing search activity. First, many ILC design strategies assume nominal knowledge of the system to be controlled. Only recently has a comprehensive approach to robust ILC analysis and design been established to handle the situation where the plant model is uncertain. Second, it is well known that many ILC algorithms do not produce monotonic convergence, though in applications monotonic convergence can be essential. This monograph addresses these two key problems by providing a unified analysis and design framework for robust monotonically convergent ILC. The particular approach used throughout is to consider ILC design in the iteration domain rather than in the time domain. Using a lifting technique, the two-dimensional ILC system, which has dynamics in both the time and iteration domains, is transformed into a one-dimensional system with dynamics only in the iteration domain. The so-called super vector framework resulting from this transformation is used to analyze both robustness and monotonic convergence for typical uncertainty models including parametric interval uncertainties, frequency-like uncertainty in the iteration domain, and iteration domain stochastic uncertainty.
