Wolfram Schommers, 2021-12-17 With the development of the scanning tunneling microscope nanoscience became an important discipline. Single atoms could be manipulated in a controlled manner and it became possible to change matter at its ultimate level. It is the level on which the properties of matter emerge. This possibility enables to construct and to produce devices, materials, etc. with very small sizes and completely new properties. That opens up new perspectives for technology and is in particular relevant in connection with nano engineering. Nanosystems are unimaginably small and very fast. No doubt this is an important characteristic. But there is another feature possibly more relevant in connection with nanoscience and nanotechnology. The essential point here is that we work at the ultimate level. This is the smallest level at which the properties of our world emerge at which functional matter can exist. In particular at this level biological individuality comes into existence. This situation can be expressed in absolute terms. This is not only the strongest material ever made, this is the strongest material it will ever be possible to make. D. Ratner and M. Ratner, Nanotechnology and Homeland Security. This is a very general statement. All aspects of matter are concerned here. Through the variation of the composition various forms of matter emerge with different items. Nanosystems are usually small but they offer nevertheless the possibility to vary the structure of atomic molecular ensembles creating a diversity of new material specific properties. A large variety of experimental possibilities come into play and flexible theoretical tools are needed at the basic level. This is reflected in the different disciplines. In nanoscience and nanotechnology we have various directions: Materials science, functional nanomaterials, nanoparticles, food chemistry, medicine with brain research, quantum and molecular computing, bioinformatics, magnetic nanostructures, nano optics, nano electronics, etc. The properties of matter which are involved within these nanodisciplines are ultimate in character, i.e. their characteristic properties come into existence at this level. The book is organized in this respect. Comprehensive Nanoscience and Technology, 2010-10-29. From the Introduction. Nanotechnology and its underpinning sciences are progressing with unprecedented rapidity. With technical advances in a variety of nanoscale fabrication and manipulation technologies the whole topical area is maturing into a vibrant field that is generating new scientific research and a burgeoning range of commercial applications with an annual market already at the trillion dollar threshold. The means of fabricating and controlling matter on the nanoscale afford striking and unprecedented opportunities to exploit a variety of exotic phenomena such as quantum nanophotonic and nanoelectromechanical effects. Moreover, researchers are elucidating new perspectives on the electronic and optical properties of matter because of the way that nanoscale materials bridge the disparate theories describing molecules and bulk matter. Surface phenomena also gain a greatly increased significance even the well known link between chemical reactivity and surface to volume ratio becomes a major determinant of physical properties when it operates over nanoscale dimensions. Against this background this comprehensive work is designed to address the need for a dynamic authoritative and readily accessible source of information capturing the full breadth of the subject. Its six volumes covering a broad spectrum of disciplines including material sciences

chemistry physics and life sciences have been written and edited by an outstanding team of international experts Addressing an extensive cross disciplinary audience each chapter aims to cover key developments in a scholarly readable and critical style providing an indispensable first point of entry to the literature for scientists and technologists from interdisciplinary fields The work focuses on the major classes of nanomaterials in terms of their synthesis structure and applications reviewing nanomaterials and their respective technologies in well structured and comprehensive articles with extensive cross references It has been a constant surprise and delight to have found amongst the rapidly escalating number who work in nanoscience and technology so many highly esteemed authors willing to contribute Sharing our anticipation of a major addition to the literature they have also captured the excitement of the field itself in each carefully crafted chapter Along with our painstaking and meticulous volume editors full credit for the success of this enterprise must go to these individuals together with our thanks for largely adhering to the given deadlines Lastly we record our sincere thanks and appreciation for the skills and professionalism of the numerous Elsevier staff who have been involved in this project notably Fiona Geraghty Megan Palmer and Greg Harris and especially Donna De Weerd Wilson who has steered it through from its inception We have greatly enjoyed working with them all as we have with each other

Compound Semiconductors Ferdinand Scholz, 2017-10-06 This book provides an overview of compound semiconductor materials and their technology After presenting a theoretical background it describes the relevant material preparation technologies for bulk and thin layer epitaxial growth It then briefly discusses the electrical optical and structural properties of semiconductors complemented by a description of the most popular characterization tools before more complex hetero and low dimensional structures are discussed A special chapter is devoted to GaN and related materials owing to their huge importance in modern optoelectronic and electronic devices on the one hand and their particular properties compared to other compound semiconductors on the other In the last part of the book the physics and functionality of optoelectronic and electronic device structures LEDs laser diodes solar cells field effect and heterojunction bipolar transistors are discussed on the basis of the specific properties of compound semiconductors presented in the preceding chapters of the book Compound semiconductors form the back bone of all opto electronic and electronic devices besides the classical Si electronics Currently the most important field is solid state lighting with highly efficient LEDs emitting visible light Also laser diodes of all wavelength ranges between mid infrared and near ultraviolet have been the enabler for a huge number of unprecedented applications like CDs and DVDs for entertainment and data storage not to speak about the internet which would be impossible without optical data communications with infrared laser diodes as key elements This book provides a concise overview over this class of materials including the most important technological aspects for their fabrication and characterisation also covering the most relevant devices based on compound semiconductors It presents therefore an excellent introduction into this subject not only for students but also for engineers and scientist who intend to put their focus on this field of science
