New Architecture In Wood Forms And Structures:

New Architecture in Wood Marc Wilhelm Lennartz, Susanne Jacob-Freitag, 2015-11-27 Timber the old raw material and building material returns There are many reasons today for building with wood and there are great advantages over conventional designs Wood is not only a renewable building material that helps reduce the levels of CO₂ and is hence good for climate change but due to modern computing and manufacturing processes it can also be used for a variety of construction tasks Wood possesses excellent qualities for both construction and indoor climate control and can easily be combined with other common building materials Based on 24 international projects the book provides an overview of the range of possibilities in wood construction today Texts images and plans document the architectural and constructive qualities of contemporary timber structures from the conceptual design to the structure in detail The various uses are based on current research in modern timber engineering but also on timber construction expertise that has been developing over many centuries This special discipline has evolved significantly in recent decades particularly in Germany Austria and Switzerland and is a world leader today

Design of Integrally-Attached Timber Plate Structures Yves Weinand, 2021-09-26 *Design of Integrally Attached Timber Plate Structures* outlines a new design methodology for digitally fabricated spatial timber plate structures presented with examples from recent construction projects It proposes an innovative and sustainable design methodology algorithmic geometry processing structural optimization and digital fabrication technology transfer and construction are formulated and widely discussed The methodology relies on integral mechanical attachment whereby the connection between timber plates is established solely through geometric manipulation without additional connectors such as nails screws dowels adhesives or welding The transdisciplinary design framework for spatial timber plate structures brings together digital architecture computer science and structural engineering covering parametric modeling and architectural computational design geometry exploration the digital fabrication assembly of engineered timber panels numerical simulations mechanical characterization design optimization and performance improvement The method is demonstrated through different prototypes physical models and three build examples focusing specifically on the design of the timber plate roof structure of 23 large span arches called the Annen Headquarters in Luxembourg This is useful for the architecture engineering and construction AEC sector and shows how new structural optimization processes can be reinvented through geometrical adaptations to control global and local geometries of complex structures This text is ideal for structural engineering professionals and architects in both industry and academia and construction companies

Systems in Timber Engineering Josef Kolb, 2008-04-23 Timber construction has become completely modernized It has gained considerably in market share with respect to competing building materials and is dominated by systems such as frame and solid timber construction Every timber construction is determined by its structure Hence it is essential to know the connections and relationships from the design stage right through to the construction phase *Systems in Timber Engineering*

takes a whole new approach to this subject It is a comprehensive analytical and visually organized treatment from the simple single family house to the large scale multistore structure It includes the building envelope which is so important for saving energy and systems for ceilings and interior dividing walls which are so essential from the vantage point of construction This work uses plans schematic drawings and pictures to show the current and forward looking state of the technology as applied in Switzerland a leading country in the field of timber construction

Structural Design in Wood Judith J.

Stalnaker,2013-04-17 Why another textbook on the design of wood sets this book apart is its inclusion of struc structures In many years of teaching structural tural planning Most textbooks show only the design in wood the authors have used virtually selection of member proportions or number of every textbook available as well as using only connectors in a joint to satisfy a given com a code and no textbook at all The textbooks pletely defined situation This book on the used have included both the old and the rela other hand shows the thinking process needed tively modem some have been fairly good but to determine whether or not the member is re in our opinion each has deficiencies Some quired in the first place Following this the books have too few solved examples Others spacing and continuity of the member are de omit important material or have an arrange cided its loads are determined and finally its ment making them difficult to use as formal shape and size are selected teaching tools By writing this book we intend We believe that illustrating structural plan to correct such deficiencies ning as well as detailed member and connec The prime purpose of this book is to serve as tion design is of considerable value in helping a classroom text for the engineering or archi the student make the transition from the often tecture student

Digital Wood Design Fabio Bianconi,Marco Filippucci,2019-02-24 This book explores various digital representation strategies that could change the future of wooden architectures by blending tradition and innovation Composed of 61 chapters written by 153 authors hailing from 5 continents 24 countries and 69 research centers it addresses advanced digital modeling with a particular focus on solutions involving generative models and dynamic value inherent to the relation between knowing how to draw and how to build Thanks to the potential of computing areas like parametric design and digital manufacturing are opening exciting new avenues for the future of construction The book s chapters are divided into five sections that connect digital wood design to integrated approaches and generative design to model synthesis and morphological comprehension to lessons learned from nature and material explorations to constructive wisdom and implementation related challenges and to parametric transfigurations and morphological optimizations

Prefabricated Systems

Ulrich Knaack,Sharon Chung-Klatte,Reinhard Hasselbach,2012-12-13 For a number of years modular construction the use of prefabricated elements in architecture has once again become a subject of lively discussion and debate Long written off as monotonous today s building components are actually highly differentiated

and capable of supporting and enhancing the architect's creativity. Numerous structures work with prefabricated components for single family homes; the figure is ninety eight percent and modular systems are available that meet high aesthetic standards. This book provides an overview of the various different systems and their possible uses particularly in the areas of housing, office and industrial buildings. It explains the processes and components of modular construction and the behavior of the various materials when this construction approach is used. The authors offer strategies for planning and designing with prefabricated systems so that the architect can use them productively. Numerous drawings explain the principles of modular construction while built examples forge a link between those principles and the practical activity of building. *The Building News and Engineering Journal*, 1886. *Advancing Wood Architecture* Achim Menges, Tobias Schwinn, Oliver David Krieg, 2016-07-22. In light of environmental challenges architecture is facing wood is no longer regarded as outmoded, nostalgic and rooted in the past but increasingly recognized as one of the most promising building materials for the future. Recent years have seen unprecedented innovation of new technologies for advancing wood architecture. *Advancing Wood Architecture* offers a comprehensive overview of the new architectural possibilities that are enabled by cutting edge computational technologies in wood construction. It provides both an overarching architectural understanding and in depth technological information through built projects and the works of four leading design research groups in Europe. The projects presented include large scale permanent buildings such as the ETH Arch Tec Lab Building in Zurich, the Landesgartenschau Exhibition Hall near Stuttgart and the Boiler House in Hooke Park UK as well as built research prototypes investigating additive robotic fabrication, folded plate structures and meteorosensitive building skins. Illustrated in full colour the book showcases the latest technological developments in design, computation, simulation and digital fabrication together with an architectural engineering and manufacturing perspective offering an outlook towards novel spatial and constructional opportunities of a material with unrivalled ecological virtues.
