Queueing Systems Leonard Kleinrock,1975 Performance Modeling for Computer Architects C. M.

Krishna,1995-10-14 As computers become more complex the number and complexity of the tasks facing the computer architect have increased Computer performance often depends in complex way on the design parameters and intuition that must be supplemented by performance studies to enhance design productivity This book introduces computer architects to computer system performance models and shows how they are relatively simple inexpensive to implement and sufficiently accurate for most purposes It discusses the development of performance models based on queueing theory and probability The text also shows how they are used to provide quick approximate calculations to indicate basic performance tradeoffs and narrow the range of parameters to consider when determining system configurations It illustrates how performance models can demonstrate how a memory system is to be configured what the cache structure should be and what incremental changes in cache size can have on the miss rate A particularly deep knowledge of probability theory or any other mathematical field to understand the papers in this volume is not required **Queueing Systems, Volume 2** Leonard

Matrix-Analytic Methods in Queues 2 Srinivas R. Chakravarthy,2022-10-18 Matrix analytic methods MAM were introduced by Professor Marcel Neuts and have been applied to a variety of stochastic models since In order to provide a clear and deep understanding of MAM while showing their power this book presents MAM concepts and explains the results using a number of worked out examples This book s approach will inform and kindle the interest of researchers attracted to this fertile field To allow readers to practice and gain experience in the algorithmic and computational procedures of MAM Introduction to Matrix Analytic Methods in Queues 2 provides a number of computational exercises It also incorporates simulation as another tool for studying complex stochastic models especially when the state space of the underlying stochastic models under analytic study grows exponentially This book s detailed approach will make it more accessible for readers interested in learning about MAM in stochastic models *Broadband Wireless Communications* Marco Luise,Silvano Pupolin,2012-12-06

Broadband Wireless Access is a highly challenging and fast changing area of multimedia radio communications These papers on the subject are the proceedings of the 9th Tyrrhenian Workshop held in Lerici Italy September 1997 They provide a prospect on the state of the art and future development with a sufficiently wide focus to cover technological architectural and regulatory issues Emphasis is given to those advances of digital signal processing techniques microwave mono lithic integrated circuits and smart antennae that will allow the design of low cost user terminals with advanced capabilities Specific attention is also devoted to the protocols these new terminals will use to access the radio medium and to the kind of

services that will eventually be provided to the end user in the future With contributions from worldwide experts the material presented here is a timely and high level overview of the field and as well as being informative is a useful tool for promoting further investigation into the area of multimedia radio communications

Cost Accounting for Shared IT

Infrastructures Reinhard Brandl, 2008-08-21 During the past few years determining the value of IT has ranked high on the agenda of IT managers and Chief Information Officers CIOs The rather broad and abstract topic has been intensively discussed in the Information Systems literature for many years It turns into a very tangible problem in the field of IT cost accounting Nowadays corporate information systems are distributed systems A detailed measurement of resource demands of IT services on a distributed IT infrastructure and respective accounting and cost allocation turns out to be very expensive and impractical in most cases The large proportion of indirect costs and the difficulty of finding adequate allocation rates are a significant problem in practice regularly leading to free rider problems This problem has largely been ignored in the academic literature so far Dr Brandl proposes a method to derive estimators for the resource demand of service requests in a distributed IT infrastructure This estimator is based on a set of load tests and respective measurements as they are often performed during the deployment phase of new information systems Cost allocation keys can now be determined based on the number of service invocations per user or per department and the respective estimators While these measurements provide a lean method for the determination of usage based cost allocation keys it is not obvious that the estimators have sufficient accuracy in particular concerning different types of services and volatile workloads
