Archaeobacteria and Eubacteria

Archaeobacteria are the oldest organisms living on the Earth. They are unicellular prokaryotes and belong to the kingdom, Archaea. Remember that **prokaryotes** do not have a nucleus that surrounds their Chromosomes. All **Eukaryotes**, including animal and plants have their chromosomes contained within a nucleus.

They were first discovered in 1977 and classified as bacteria. Most archaeobacteria appear like bacteria, when observed under the microscope. However, they are quite different from bacteria and eukaryotic organisms.

Archaeobacteria are found in very harsh conditions such as in the volcanic vents or at the bottom of the sea. They are often called "**extremophiles**". They can easily survive in such extreme environment as sea vents releasing sulfide-rich gases, hot springs, or boiling mud around volcanoes. They are found in the depths of the ocean. They are found in these place also swamps, deep-sea waters, sewage treatment facilities, and even in the stomachs of cows. This type of bacteria is different from the common type of bacteria that we see every day called Eubacteria.

Eubacteria are microscopic single-celled organisms. They are sometimes referred to as the "true bacteria," differentiating them from Archaeobacteria. The vast majority of organisms we think of as "bacteria" are Eubacteria. Eubacteria are responsible for many human diseases, but also help maintain health and play an important role in keeping the planet healthy.

1. What makes prokaryotes different from Eukaryotes?

Growth and Development

Most bacteria fall into 3 shape categories: spheres (Cocci), rods (Bacilli), and spirals (Spirilli). There are several others, but these 3 are the most common. The picture to the right

shows the different shapes. As for the growth part, bacteria do not grow like humans. There is no "baby" stage to "adult" stage. Bacteria are a one-size fits all kind of like you being born as a full grown

adult (we probably wouldn't need car seats).

2. What are the 3 shapes of bacteria?

Reproduction

Archeobacteria reproduces by a process called **binary fission**. This process is similar to mitosis in that one cell becomes two cells. This process does not happen in seconds it actually takes about 20 minutes for a bacteria cell to divide. This is much quicker than a human cell that can take up to or more than 24 hours to divide.
