Quantum Information Processing With Light:

Quantum Information Processing with Light Debabrata Goswami, 2016-01-15 This cross disciplinary field utilizes the strange effects of quantum mechanics to enable information processing and computing that would be impossible on traditional classical computers The field has developed rapidly over the last few years due in part to its tremendous technological potential The theoretical foundations of the subject are clearly established and good textbooks are available However many experimental directions are under investigation and hardly any book describing them is available on the market Quantum cryptography for example has already evolved to marketable devices Most of the books on quantum information and or quantum computing address the important aspect of optical implementation only briefly This book solves that by focusing on all light based approaches to quantum computing *Introduction to Optical Quantum Information Processing* Pieter Kok, Brendon W. Lovett, 2010-04-22 Quantum information processing offers fundamental improvements over classical information processing such as computing power secure communication and high precision measurements However the best way to create practical devices is not yet known This textbook describes the techniques that are likely to be used in implementing optical quantum information processors After developing the fundamental concepts in quantum optics and quantum information theory the book shows how optical systems can be used to build quantum computers according to the most recent ideas It discusses implementations based on single photons and linear optics optically controlled atoms and solid state systems atomic ensembles and optical continuous variables This book is ideal for graduate students beginning research in optical quantum information processing It presents the most important techniques of the field using worked examples and over 120 exercises *Integrated Nanophotonics* Peng Yu, Hongxing Xu, Zhiming Wang, 2023-05-31 Integrated Nanophotonics Helps readers understand the important advances in nanophotonics materials development and their latest applications This book introduces the current state of and emerging trends in the development of integrated nanophotonics Written by three well qualified authors it systematically reviews the knowledge of integrated nanophotonics from theory to the most recent technological developments It also covers the applications of integrated nanophotonics in essential areas such as neuromorphic computing biosensing and optical communications Lastly it brings together the latest advancements in the key principles of photonic integrated circuits plus the recent advances in tackling the barriers in photonic integrated circuits Sample topics included in this comprehensive resource include Platforms for integrated nanophotonics including lithium niobate nanophotonics indium phosphide nanophotonics silicon nanophotonics and nonlinear optics for integrated photonics The devices and technologies for integrated nanophotonics in on chip light sources optical packaging of photonic integrated circuits optical interconnects and light processing devices Applications on neuromorphic computing biosensing LIDAR and computing for AI and artificial neural network and deep learning Materials scientists physicists and physical chemists can use this book to understand the totality of cutting edge theory research and applications in the field of

integrated nanophotonics **Quantum Information Processing** Gerd Leuchs, 2003-04-09 The possible realization of quantum computers within the next two decades could cause a revolution in data processing and cryptography Here leading experts in the field of quantum information technology summarize recent developments by way of a cross disciplinary link between different technical and theoretical approaches *Quantum Information Processing and Communication in Europe* Antonella Karlson, 2005 **New Light Sources for Quantum Information Processing -- Single Photons from Single Quantum Dots and Cavity-Enhanced Parametric Down-Conversion** Matthias Scholz, 2009 The outstanding research efforts in quantum information processing over the past two decades reflect the promise this field of physics provides for practical applications in information science as well as for new approaches towards a better understanding of fundamental questions in quantum mechanics This thesis focuses on the photon as a principal resource to perform quantum information tasks and on schemes to imprint quantum bits onto its various degrees of freedom Its weak coupling to the environment makes the photon an ideal carrier to securely transmit information by quantum cryptographic protocols Moreover efficient implementations of quantum computing using solely linear optics have been proven Unfortunately scalability is not easily achieved by a purely photonic approach since the generation of indistinguishable single photons from multiple emitters remains a difficult task Thus proposals for more complex quantum networks suggest an architecture with single photons as information carriers between atomic ensembles that act as storage and processing nodes Computations including a limited number of qubits however may be performed by the linear optics scheme The thesis starts with the generation and characterization of single photon states using a source based on a single optically pumped quantum dot The capability of these states to implement a quantum algorithm using linear optics and single photon interference is experimentally demonstrated for the first time Error correction makes the interferometric setup robust against phase noise After successful realization of this proof of principle experiment attention is drawn to the need of plug and play single photon sources Especially quantum key distribution the most advanced quantum information technology to date which has even found its way into commercial devices requires compact and low cost non classical light sources Therefore a single photon source based on electrically pumped quantum dots is presented that exhibits unmatched spectral purity and single photon statistics Results towards the realization of quantum networks are presented in the following chapters covering the generation of narrow band single photons which can efficiently couple to atomic resonances Photons with a spectral width of less than 3 MHz are created by ultra bright cavity enhanced spontaneous parametric down conversion and their quantum statistics is studied in detail A setup for time bin encoding is demonstrated capable of imprinting quantum information onto these narrow band single photons This thesis concludes with slow light experiments in atomic ensembles as a model system for atom photon interaction on the single photon level The described experiments demonstrate striking features that make the single photon one of the most remarkable physical systems for the field of quantum information **Quantum Optics and**

Quantum Information Processing in Rare-earth-ion-doped Crystals Nicklas Ohlsson, 2003 *Quantum Information with Continuous Variables of Atoms and Light* N. J. Cerf, Gerd Leuchs, E. S. Polzik, 2007 Quantum information describes the new field which bridges quantum physics and information science The quantum world allows for completely new architectures and protocols While originally formulated in continuous quantum variables the field worked almost exclusively with discrete variables such as single photons and photon pairs The renaissance of continuous variables came with European research consortia such as ACQUIRE Advanced Coherent Quantum Information Research in the late 1990s and QUICOV Quantum Information with Continuous Variables from 2000 OCo 2003 The encouraging research results of QUICOV and the new conference series CVQIP Continuous Variable Quantum Information Processing triggered the idea for this book This book presents the state of the art of quantum information with continuous quantum variables The individual chapters discuss results achieved in QUICOV and presented at the first five CVQIP conferences from 2002 OCo 2006 Many world leading scientists working on continuous variables outside Europe also contribute to the book

Handbook on the Physics and Chemistry of Rare Earths, 2014-11-27 The Handbook on the Physics and Chemistry of Rare Earths is a continuous series of books covering all aspects of rare earth science chemistry life sciences materials science and physics The main emphasis of the Handbook is on rare earth elements Sc Y and the lanthanides La through Lu but whenever relevant information is also included on the closely related actinide elements The individual chapters are comprehensive broad up to date critical reviews written by highly experienced invited experts The series which was started in 1978 by Professor Karl A Gschneidner Jr combines and integrates both the fundamentals and applications of these elements and now publishes two volumes a year Individual chapters are comprehensive broad critical reviews Contributions are written by highly experienced invited experts Up to date overviews of developments in the field
