Detection Systems Installation Performance Criteria Daniel T. Gottuk, 2012-06-02 Computer processing and image analysis
technologies have improved substantially over the course of the past decade This rapidly advancing technology along with
the emphasis on video surveillance since 911 has propelled the development of effective video image detection VID systems
for re Fire protection system designers initially employed these VID systems for use in large facilities outdoor locations and
tunnels However video based detection is being used for a broadening range of applications e g 1 For example these systems
are c rently installed in electrical power plants paper mills document storage facilities historic municipal buildings nuclear
research facilities automotive plants wa house distribution centers and onshore and offshore oil platforms The 2007 edition
of NFPA 72 National Fire Alarm Code 2 recognized the use of VID systems for ame and smoke detection Although recognized
there is limited prescriptive installation and use requirements and there is a general desire by many for the development of
performance criteria that ultimately could be utilized for the design of systems or the creation of standards Since the
underlying VID technology and development of standard and network based camera systems are in a period of fairly rapid
advancement 3 5 it is not possible to de ne a comprehensive set of stand alone prescriptive requirements The performance of
VID systems depends on both the video hardware and the software algorithms there is no basic underlying principle such as
there is for ionization or pho electric detection for smoke detectors Consequently performance based inst lation and
operation requirements are needed Fire and Life Safety Inspection Manual Robert E. Solomon, 2002 Protect lives and
