Climate Change A. Barrie Pittock,2017-07-28 Is climate change really happening and does it matter The answer from the scientific community is a resounding yes yet debates about the reality of climate change and what measures to take are slowing our response Barrie Pittock one of the world s leading climate researchers argues that we need to act urgently to avoid increasingly severe climate change He looks at the controversy around global warming and other predicted changes examining the scientific basis of the changes observed to date how they relate to natural variations and why the evidence points to larger changes later this century The effect of these changes on our natural systems and our lifestyles will be considerable and could include wild weather shifts in global ocean circulation decreases in crop yields and sea level rises But the impacts won t be distributed evenly some countries will suffer more than others Climate Change Turning up the Heat explains how our attitudes to risk and uncertainty constant companions in life influence our decision making and ultimately how much we and future generations stand to lose from rapid climate change It outlines the current concerns of the major international players and reviews the response to date detailing national interests Importantly it shows there is real hope of managing climate change and minimising the risk of disaster if we step up efforts to develop and apply innovative technological and policy solutions [Choice](#) ,1999

Climate of the Past, Present and Future Javier Vinós,2022-09-20 This book is an unorthodox ground breaking scientific study on natural climate change and its contribution

to ongoing multi centennial global warming The book critically reviews the effect of the following on climate Milankovitch cycles abrupt glacial Dansgaard Oeschger events Holocene climate variability the 1500 year cycle solar activity volcanic eruptions greenhouse gases energy transport Applying the scientific method to available evidence reveals that some of these phenomena are profoundly misunderstood by most researchers Milankovitch cycles are tied to orbital obliquity not to orbital precessional summer insolation glacial megatides might have triggered abrupt Dansgaard Oeschger events and tides are likely responsible for the related 1500 year climate cycle Climate change affects volcanic eruptions more than the opposite and secular variations in solar activity are more important to climate change during the Holocene than greenhouse gases In this book we see how important natural climate change has been on human societies of the past It also produces new climate projections for the 21st century and when the next glaciation could happen What emerges from this study of natural climate change is a central theme Variations in the transport of energy from the tropics to the poles have been neglected as a cause of climate change and solar activity variations affect climate by modulating this transport The author tells us Transporting more energy from a greenhouse gas rich region the tropics to a greenhouse gas poor region the poles increases the amount of energy lost at the top of the atmosphere The effect resembles a reduction in the greenhouse gas content The book presents the Winter Gatekeeper Hypothesis on how variations in solar activity regulate Earth s energy transport and in so doing affect atmospheric circulation the rotation of the planet and the El Ni o Southern Oscillation This book is oriented toward students and academics in the climate sciences and climate anthropology and should also appeal to readers interested in the science of natural climate change The repercussions of Climate of the Past Present and Future are far reaching By uncovering a strong natural climate change component it provides a novel view of anthropogenic climate change fossil energy use and our future climate a view quite different from the IPCC s gloomy projections *Paleoclimatology* Raymond S.
