Development of control concepts for improved driving dynamics of harvesting machines with large headers Benedikt Jung, 2018-06-27 This book examines the driving dynamics of harvesting machines with large harvesting heads It looks at how to efficiently use these machines The author explores a common problem that hinders machine performance when harvesting with very large headers He deals with concepts for reducing the undesired effects of vehicle dynamics when using these machines With the steadily increasing capacity of harvesting machines the working widths of the harvesting heads get wider and the headers get heavier It has become essential with these giant headers to use header height sensors and header control systems to avoid the headers from being run into the ground when encountering elevation changes in the terrain A fundamental limitation of the viable speed of header height adjustments arises from the combination of the wider and heavier headers with soft agricultural tires The current solution to find an appropriate speed of header height adjustments is to perform a header calibration whenever a new header is attached to the machine and to endow the machine operator with the capability to tweak the speed of adjustments manually The result of an inappropriate speed of height adjustments is a reduction in overall productivity and an under utilization of the harvesting machine The author looks at ways to prevent this He offers detailed modeling of the vertical dynamics including dynamic wheel loads In addition the book contains results from simulations and machine tests

renewable and sustainable energy production Its increasing consumption is mainly related to the increase in global energy demand and fossil fuel prices but also to a lower environmental impact compared to non renewable fuels These factors take RED II directives into consideration In the past forestry interventions were the main supply source of biomass but in recent decades two others sources have entered the international scene These are dedicated energy crops and agricultural residues which are important sources of biomass for biofuel and bioenergy Below we consider four main value chains Oil crops Oil production from non food oilseed crops such as camelina Crambe safflower castor cuphea cardoon etc oil extraction and oil utilization for fuel production Lignocellulosic crops Biomass production from perennial grasses miscanthus giant reed switchgrass reed canary grass etc woody crops willow poplar Robinia eucalyptus etc and agricultural residues pruning maize cob maize stalks wheat chaff sugar cane straw etc considering two main transformation systems 1 Electricity heat production 2 Second generation ethanol production Carbohydrate crops cereals sweet sorghum sugar beets sugar cane etc for ethanol production Fermentable crops maize barley triticale Sudan grass sorghum etc and agricultural residues chaff maize stalks and cob fruit and vegetable waste etc for production of biogas and or biomethane
