Membrane Filtration A Problem Solving Approach With Matlab:

Membrane Filtration Greg Foley,2013-07-04 A hands on problem solving approach to the engineering of membrane filtration processes from microfiltration to reverse osmosis Membrane Filtration Greg Foley,2013-07-04 Focusing on the application of membranes in an engineering context this hands on computational guide makes previously challenging problems routine It formulates problems as systems of equations solved with MATLAB encouraging active learning through worked examples and end of chapter problems The detailed treatments of dead end filtration include novel approaches to constant rate filtration and filtration with a centrifugal pump The discussion of crossflow microfiltration includes the use of kinetic and force balance models Comprehensive coverage of ultrafiltration and diafiltration processes employs both limiting flux and osmotic pressure models The effect of fluid viscosity on the mass transfer coefficient is explored in detail the effects of incomplete rejection on the design and analysis of ultrafiltration and diafiltration are analysed and quantitative treatments of reverse osmosis and nanofiltration process analysis and design are explored Includes a chapter dedicated to the modelling of membrane fouling **Optimal Operation of Batch Membrane Processes** Radoslav Paulen,Miroslav Fikar,2015-09-24

This study concentrates on a general optimization of a particular class of membrane separation processes those involving batch diafiltration Existing practices are explained and operational improvements based on optimal control theory are suggested The first part of the book introduces the theory of membrane processes optimal control and dynamic optimization Separation problems are defined and mathematical models of batch membrane processes derived The control theory focuses on problems of dynamic optimization from a chemical engineering point of view Analytical and numerical methods that can be exploited to treat problems of optimal control for membrane processes are described The second part of the text builds on this theoretical basis to establish solutions for membrane models of increasing complexity Each chapter starts with a derivation of optimal operation and continues with case studies exemplifying various aspects of the control problems under consideration The authors work their way from the limiting flux model through increasingly generalized models to propose a simple numerical approach to the general case of optimal operation for batch diafiltration processes Researchers interested in the modelling of batch processes or in the potential industrial applications of optimal control theory will find this monograph a valuable source of inspiration instruction and ideas Water Management Iqbal M. Mujtaba,Thokozani

Deterministic Flexibility Analysis Chuei-Tin Chang,Vincentius Surya Kurnia Adi,2017-07-28 Traditionally design and control decisions are made in sequential stages over the life cycle of a chemical plant In the design phase the optimal operating conditions and the corresponding material and energy balance data are established mainly on the basis of economic considerations In the subsequent step the control systems are configured to maintain the key process conditions at the fixed nominal values Because it is often desirable to address the operability issues at the earliest possible stage before stipulation of control schemes the systematic incorporation of flexibility analysis in process synthesis and design has received considerable attention in recent years This book focuses to a large extent on computation and implementation methods of deterministic performance measures i e the steady state volumetric dynamic and temporal flexibility indices in various applications The formal definitions of several available performance indices their mathematical formulations and the corresponding algorithms and codes are provided in sufficient detail to facilitate implementation To show the utility of flexibility analyses the book presents several practical case studies including membrane modules and heat exchanger networks solar driven membrane distillation desalination systems and hybrid power generation systems It also includes MATLAB and GAMS codes
