

Rivers and Streams Teacher's Guide

Rivers and streams contain water in motion. Running water is beneficial to supporting aquatic organisms because the constant movement aerates the water, providing oxygen necessary for survival. The movement of water also keeps nutrients available and flushes wastes further downstream. Running water also can cause some loss of life, such as experienced during a flood, with organisms moved downstream, into flood plains and away from flowing water or unable to survive the increased flow and dying.

Illinois has 106,900 miles of rivers and streams within its borders (see Figure 1). It is estimated that the surface area of Illinois' interior rivers and streams is 325,000 acres.

Definition

Rivers and streams are deep water habitats contained within a channel. If water flows through the channel throughout the year, the river or stream is called a perennial stream. An intermittent stream has water flowing only part of the year. The smaller streams that feed into larger rivers and streams are called tributaries. The land adjacent to a river or stream that is periodically flooded is called the flood plain.

Young or immature streams are short and flow swiftly, thus the rate of erosion is great. The channels of these streams are usually straight, with a v-shaped bottom. Older or mature streams have wide, flat-bottomed, or u-shaped channels. The water flows slower, and the rate of erosion is less. It is a natural process for bodies of water to evolve. Water is dynamic, not static.

The rate water flows within a channel is called velocity. Many factors can influence the velocity of water. The gradient (pitch) of the channel, volume of water flowing and amount of area the stream drains (watershed) influence the flow of water. Recent precipitation, or lack of precipitation, will contribute to the stream's velocity. Stream flow also is affected by the composition or type of material in the stream bed (sand, silt, mud, gravel, bedrock).

Every river and stream has a watershed or drainage basin. This is the total land area that provides water to the river or stream. Along with the surface water runoff, these bodies of water receive sedimentation and other materials from the watershed. Many rivers flood regularly, increasing productivity and enriching flood

plains with sediment and nutrients. Changes to the Mississippi and Illinois rivers, such as levees and locks and dams, have diminished the natural flooding cycles and reduced productivity of these systems. So, while flooding may be a problem for humans, it is an important and natural process for rivers.
